ABSTRACT: This paper provides an in-depth and comprehensive study to date on how students perceive the effects of the first wave of the COVID-19 crisis in early 2020 on various aspects of their health at the global level. With a sample of 30,383 students from 62 countries, the study revealed that between the global closure and the transition to online tuition students are very satisfied with the support provided by teaching and community relations staff and their universities. However, a lack of computer skills and a high level of workload prevented them from seeing their improved performance in a new teaching environment

Key words: coronavirus, COVID-19, education, online learning, technology, EdTech

I. INTRODUCTION

Thousands of people have turned to the internet to teach them to complete their education so that they can excel in their careers and take appropriate courses or improve their quality of education. and It is well-known that online education is not for everyone, not for students who are not governed by consistent educators, and there is a distinction between online education and traditional education, and it has variations. Online education can be defined as media that is supported, remotely, or recommended and supported by specific educational programs, bakkies can also be defined as a formal teaching and learning program offered because it can learn through electronic and Internet media, and online education at low cost. It is well known that Online Education offers many opportunities Cases where it is difficult in traditional education for students with difficulty planning or grades and grade education can be simpler and flexible depending on the time and place. Three popular Online Education technologies include Word-based technologies, such as CD or MP3 recording, Video technology, such as instructional videos, DVDs, and video videoconferencing, and Computer-based technology delivered via the Internet or company

intranet. While traditional education provides a budget for many needs such as housing and gas, and other needs for students in online education they do not need, with the student's ability for full education in But, we can conclude that Be extraordinary use and transportation, by going to the study.

II. SIGNIFICANCE OF THE STUDY

Online education has become increasingly popular among working professionals and students pursuing higher education. These online student groups greatly benefit from the freedom and flexibility of these courses. Online courses covering full-time employment, internships, and family care can be arranged on their schedule. Studying online will also help them spend quiet time studying. Even before technology became more accessible, learning distances were long overdue. The traditional school now sees an increase in practical training materials and online courses. Even in the world of tried and tested school systems, only the most successful schools are up to the changing times, as well as the expectations of students, parents, and the community. If online education is going to stay here, the research has the following questions What are the implications for traditional learning? Instead of focusing on the pros and cons, the conversation we need to talk about today is using online education to prepare our curriculum for learning. Online courses require more financial encouragement and discipline than classroom study.

Objective of online learning There are some goals when it comes to eLearning and some of them are:

- 1.Improve the quality of learning and teaching
- 2.Meet the learning style or student needs
- 3.Improve efficiency and efficiency
- 4.Improve user access and flexible time to engage students in the learning process

Mastery of online learning

While traditional universities are still considered by many to be the best way to gain knowledge and get a diploma, online learning is proving to be a good alternative. Students have the opportunity to learn in their own time and especially for free. This is a great way to learn multiple disciplines and increase the level of motivation. Online learning can be very effective because students can finish their homework quickly and have plenty of time left for hobbies or work. The availability of all traditional learning resources allows participants to learn anywhere, and they are free to choose their own study time. With a basic internet connection, one can attend various courses. The benefits of online learning include responsibility and self-discipline.

Online education in a school environment As students progress to higher grades in school, they want more freedom and freedom to understand. Online learning can help them pursue personalized curricula, perhaps even college courses. This, combined with fitness, real-world research, and extensive testing, can be very helpful for their further study. Before coming to a specialty, they can see their preferences by trying introductory topics from different fields. Online learning sites can help these students become more independent students before entering college. I hope that we should not shy away from pursuing students' online studies, but rather guide them as they go. Mobile applications that provide advanced learning opportunities for school children have become as popular as the end of the world. These apps are used to add learning in the classroom as cell phones have already found a way to get their hands on them. Teachers and parents need to act as announcers and mentors at this deceptive stage of minimizing the type of content students are learning and evaluating the appropriate work to be done. Public schools offering full K-12 education are already emerging in other parts of the world. They also offer a combination of traditional practice and online education. India is nothing new to e-Learning, for example, Coursera, an American learning platform founded in 2012 with over 35 million users, and India is only second in the United States in terms of the number of people studying these courses. The great advantage of offline learning online is its flexibility. A student can learn from anywhere in the world during his or her time. Besides, students in our country are often very cautious when it comes to spending time and travel, the cost of travel and the high cost of offline add to the woes of their busy schedule in another

way. Further technological advances will only lead to more student attraction and by 2021 our eLearning of India will cost \$ 2 billion. Online learning has covered a lot of space in recent times and the interface is easy to use and besides, the student gets the learning experience by sitting in the corners of their rooms. There are places to connect with your teachers and students of the same subject. The biggest trump card is its flexible timeline. Students can find solutions to their problems not only during class hours but also during their studies via email or online chat. Tests are mostly done online today because of how well they work and because of the tests, designed in an online format, eLearning enables students to become familiar with the test environment and thus increase their response time and chances of success. With the availability of a variety of courses with an endless number of teachers with demos and refund policies, student satisfaction is always given priority. The teacher in online learning continues to improve and adds to their teaching skills better compared to their peers so that they live in this dignified environment that enhances user knowledge and contributes to their overall development.

III. THE PSYCHOLOGICAL AND SOCIO-ECONOMIC IMPACT ON ONLINE LEARNING

For the majority of people, arrests mean living in cramped conditions long-term, which has a profound impact on human mental health as well in terms of increased exposure to children and youth in situations of violence. According to ECLAC / UNICEF (2020), 51.2% of children and adolescents in urban areas of Latin America live in the case of poor housing to some extent. Two out of ten live in extreme poverty housing conditions while three out of ten live in very poor housing conditions. In other words, more than 80 million children and adolescents in urban areas live in poor housing conditions and another 18 million live in extreme poverty

Research has shown what is important the relationship between deprivation in the context of housing and the violation of other child rights. Overcrowding means ample space for study and relaxation, which results in comprehension advancement in childhood and work and social life into adulthood, while also growing susceptibility to abuse situations (ECLAC / UNICEF, 2020). In emergencies, schools are a basic place for emotional support, risk monitoring, educational continuity, and social and material support for students and their families

Drawbacks of online learning

Only one person can thrive in a small group. At school, students learn to make friends, be patient, deal with frustration, and especially compete. Competition between partners is very encouraging and only students will benefit from this. Learning online does not provide human interactions. Another drawback is that online courses can not cope with the thousands of students who try to join the discussions. Also, learning online can be difficult if it is for instruction that includes training. In conclusion, online learning should be considered a compliment to the expansion of older learning patterns. Even the best online course will not completely reconnect with a relationship or human relationships that will grow as a group. Therefore, traditional classes should not be replaced by online education.

IV. CONCLUSION

Current research supports the use of online learning in medical and dental institutions, considering its various benefits. Online learning strategies promote student-centered learning and are easily manageable in this closed environment. The concept of online classes at this time of COVID-19 is very good but as it seems there are many risks associated with it so it is necessary to take all necessary precautions. The youngest students for them are the job of the teachers, the Government, the parents to keep them safe while online and to teach them to get the best out of them and to be able to attend classes well. E-classes are very helpful in these times of closure and limitation of virtual classes. Teaching - learning activities are done successfully. Students believe that online classes are better but are more comfortable with e - class as well. Network problems are a major obstacle to smooth transition.
