## ABSTRACT

The Non-homogeneous ternary quadratic Diophantine equation
$4\left(x^{2}+y^{2}\right)-7 x y+x+y+1=31 z^{2}$ is studied for finding its non - zero distinct integer solutions.
KEY WORDS: Non-homogeneous, Ternary quadratic equation, Integral solutions .

## I. INTRODUCTION

Ternary quadratic equations are rich in variety [14, 17-20].For an extensive review of sizable literature and various problems, one may refer [516]. In this communication, we consider yet another interesting Non- homogeneous ternary quadratic equation
$4\left(x^{2}+y^{2}\right)-7 x y+x+y+1=31 z^{2} \quad$ and obtain infinitely many non-trivial integral solutions.

## II. METHOD OF ANALYSIS

Let $\mathrm{X}, \mathrm{y}, \mathrm{Z}$ be any three non-zero distinct integers such that

$$
\begin{equation*}
4\left(x^{2}+y^{2}\right)-7 x y+x+y+1=31 z^{2} \tag{1}
\end{equation*}
$$

Substituting

$$
\left.\begin{array}{l}
\mathrm{x}=\mathrm{u}+\mathrm{v}  \tag{2}\\
\mathrm{y}=\mathrm{u}-\mathrm{v}
\end{array}\right\}
$$

in (1), we have
$\mathrm{U}^{2}+15 \mathrm{v}^{2}=31 \mathrm{z}^{2}$
where

$$
\begin{equation*}
\mathrm{u}+1=\mathrm{U} \tag{3}
\end{equation*}
$$

(3) is solved through different methods for obtaining the values of
$\mathrm{U}, \mathrm{v}, \mathrm{z}$.In view of (4) and (2), the corresponding values of $\mathrm{X}, \mathrm{y}$ are obtained.
The above process is illustrated below:

## METHOD-1

(3) is written in the form of ratio as

$$
\begin{equation*}
\frac{U+4 z}{(z-v)}=\frac{15(z+v)}{U-4 z}=\frac{\alpha}{\beta}, \quad \beta \neq 0 \tag{5}
\end{equation*}
$$

which is equivalent to the system of equations

$$
\begin{gathered}
\mathrm{U} \beta+\mathrm{v} \alpha+(4 \beta-\alpha) \mathrm{z}=0 \\
-\mathrm{U} \alpha+15 \mathrm{v} \beta+(4 \alpha+15 \beta) \mathrm{z}=0
\end{gathered}
$$

Employing the method of cross multiplication and simplifying, we have

$$
\begin{align*}
& U=4 \alpha^{2}-60 \beta^{2}+30 \alpha \beta  \tag{6}\\
& v=\alpha^{2}-15 \beta^{2}-8 \alpha \beta  \tag{7}\\
& z=\alpha^{2}+15 \beta^{2} \tag{8}
\end{align*}
$$

Using (6) in (4) we have

$$
\begin{equation*}
\mathrm{u}=4 \alpha^{2}-60 \beta^{2}+30 \alpha \beta-1 \tag{9}
\end{equation*}
$$

Using (7) and (9) in (2), we have

$$
\left.\begin{array}{l}
x=5 \alpha^{2}-75 \beta^{2}+22 \alpha \beta-1  \tag{10}\\
y=3 \alpha^{2}-45 \beta^{2}+38 \alpha \beta-1
\end{array}\right\}
$$

Thus (8) and (10) represent the non-zero distinct integer solution to (1).

## NOTE:

In addition to (5), (3) is written in the form of ratio as below:
(i) $\frac{U+4 z}{15(z-v)}=\frac{(z+v)}{U-4 z}=\frac{\alpha}{\beta}, \beta \neq 0$
(ii) $\frac{\mathrm{U}+4 \mathrm{z}}{5(\mathrm{z}-\mathrm{v})}=\frac{3(\mathrm{z}+\mathrm{v})}{\mathrm{U}-4 \mathrm{z}}=\frac{\alpha}{\beta}, \beta \neq 0$
(iii) $\frac{\mathrm{U}+4 \mathrm{z}}{3(\mathrm{z}-\mathrm{v})}=\frac{5(\mathrm{z}+\mathrm{v})}{\mathrm{U}-4 \mathrm{z}}=\frac{\alpha}{\beta}, \beta \neq 0$

Following the procedure as above, the corresponding integer solutions to (1) thus obtained from each of the above cases are exhibited below: Solutions from (i):
$\mathrm{x}=75 \alpha^{2}-5 \beta^{2}+22 \alpha \beta-1$
$y=45 \alpha^{2}-3 \beta^{2}+38 \alpha \beta-1$
$\mathrm{z}=15 \alpha^{2}+\beta^{2}$
Solutions from (ii):

$$
\begin{aligned}
& \mathrm{x}=25 \alpha^{2}-15 \beta^{2}+22 \alpha \beta-1 \\
& \mathrm{y}=15 \alpha^{2}-9 \beta^{2}+38 \alpha \beta-1 \\
& \mathrm{z}=5 \alpha^{2}+3 \beta^{2}
\end{aligned}
$$

Solutions from (iii):

$$
\begin{aligned}
& \mathrm{x}=15 \alpha^{2}-25 \beta^{2}+22 \alpha \beta-1 \\
& \mathrm{y}=9 \alpha^{2}-15 \beta^{2}+38 \alpha \beta-1 \\
& \mathrm{z}=3 \alpha^{2}+5 \beta^{2}
\end{aligned}
$$

METHOD 2:
Introducing the linear transformations
$\mathrm{z}=\mathrm{X}+15 \mathrm{~T}, \quad \mathrm{v}=\mathrm{X}+31 \mathrm{~T}, \mathrm{U}=4 \mathrm{~W}$
$\mathrm{X}^{2}=465 \mathrm{~T}^{2}+\mathrm{W}^{2}$
which is satisfied by

$$
\left.\begin{array}{l}
X=465 r^{2}+s^{2}  \tag{12}\\
T=2 r s \\
W=465 r^{2}-s^{2}
\end{array}\right\}
$$

Using (13) in (11), we get

$$
\begin{gather*}
z=465 r^{2}+s^{2}+30 r s  \tag{14}\\
v=465 r^{2}+s^{2}+62 r s  \tag{15}\\
U=4\left(465 r^{2}-s^{2}\right) \tag{16}
\end{gather*}
$$

In view of (4), note that

$$
\begin{equation*}
\mathrm{u}=1860 \mathrm{r}^{2}-4 \mathrm{~s}^{2}-1 \tag{17}
\end{equation*}
$$

Using (15) and (17) in (2), we have
$\left.\begin{array}{l}x=2325 r^{2}-3 s^{2}+62 r s-1 \\ y=1395 r^{2}-5 s^{2}-62 r s-1\end{array}\right\}$
Thus (14) and (18) represent the non-zero distinct integer solutions to (1).
Further, (12) can be expressed as the system of double equations as shown in Table 1 below:

Table 1: System of double equations

| System | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ | $\mathbf{9}$ | $\mathbf{1 0}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}+\mathrm{W}$ | 465 | $\mathrm{~T}^{2}$ | $5 \mathrm{~T}^{2}$ | $15 \mathrm{~T}^{2}$ | $31 \mathrm{~T}^{2}$ | $155 \mathrm{~T}^{2}$ | 465 T | 93 T | 31 T | 155 T |
| $\mathrm{X}-\mathrm{W}$ | $\mathrm{T}^{2}$ | 465 | 93 | 31 | 15 | 3 | T | 5 T | 15 T | 3 T |

For simplicity and brevity, the integer solutions to (1) obtained on solving each of the above system of equations are exhibited in Table 2 below:

Table 2: Solutions

| System | $\mathbf{x}$ | $\mathbf{y}$ | $\mathbf{z}$ |
| :---: | :---: | :---: | :---: |
| $\mathbf{1}$ | $-6 \mathrm{k}^{2}+56 \mathrm{k}+1191$ | $-10 \mathrm{k}^{2}-72 \mathrm{k}+663$ | $2 \mathrm{k}^{2}+32 \mathrm{k}+248$ |
| $\mathbf{2}$ | $10 \mathrm{k}^{2}+72 \mathrm{k}-665$ | $6 \mathrm{k}^{2}-56 \mathrm{k}-1193$ | $2 \mathrm{k}^{2}+32 \mathrm{k}+248$ |
| $\mathbf{3}$ | $50 \mathrm{k}^{2}+112 \mathrm{k}-97$ | $30 \mathrm{k}^{2}-32 \mathrm{k}-257$ | $10 \mathrm{k}^{2}+40 \mathrm{k}+64$ |
| $\mathbf{4}$ | $150 \mathrm{k}^{2}+212 \mathrm{k}+21$ | $90 \mathrm{k}^{2}+28 \mathrm{k}-87$ | $30 \mathrm{k}^{2}+60 \mathrm{k}+38$ |
| $\mathbf{5}$ | $310 \mathrm{k}^{2}+372 \mathrm{k}+85$ | $186 \mathrm{k}^{2}+124 \mathrm{k}-23$ | $62 \mathrm{k}^{2}+92 \mathrm{k}+38$ |
| $\mathbf{6}$ | $1550 \mathrm{k}^{2}+1612 \mathrm{k}+413$ | $930 \mathrm{k}^{2}+868 \mathrm{k}+193$ | $310 \mathrm{k}^{2}+340 \mathrm{k}+94$ |
| $\mathbf{7}$ | $1192 \mathrm{~T}-1$ | $664 \mathrm{~T}-1$ | 248 T |
| $\mathbf{8}$ | $256 \mathrm{~T}-1$ | $96 \mathrm{~T}-1$ | 64 T |
| $\mathbf{9}$ | $86 \mathrm{~T}-1$ | $-22 \mathrm{~T}-1$ | 38 T |
| $\mathbf{1 0}$ | $414 \mathrm{~T}-1$ | $194 \mathrm{~T}-1$ | 94 T |

## METHOD 3:

Write z as

$$
\begin{equation*}
\mathrm{z}=\alpha^{2}+15 \beta^{2} \tag{19}
\end{equation*}
$$

Also, 31 is written as

$$
\begin{equation*}
31=(4+\mathrm{i} \sqrt{15})(4-\mathrm{i} \sqrt{15}) \tag{20}
\end{equation*}
$$

Substituting (19) and (20) in (3) and employing the factorization method, define

$$
(\mathrm{U}+\mathrm{i} \sqrt{15} \mathrm{v})=(4+\mathrm{i} \sqrt{15})(\alpha+\mathrm{i} \sqrt{15} \beta)^{2}
$$

On equating the real and imaginary parts, we have

$$
\begin{align*}
& \mathrm{U}=4 \alpha^{2}-60 \beta^{2}-30 \alpha \beta  \tag{21}\\
& \mathrm{v}=\alpha^{2}-15 \beta^{2}+8 \alpha \beta \tag{22}
\end{align*}
$$

Using (21) in (4) we have

$$
\begin{equation*}
\mathrm{u}=4 \alpha^{2}-60 \beta^{2}-30 \alpha \beta-1 \tag{23}
\end{equation*}
$$

Using (22) and (23) in (2) we have

$$
\left.\begin{array}{l}
x=5 \alpha^{2}-75 \beta^{2}-22 \alpha \beta-1  \tag{24}\\
y=3 \alpha^{2}-45 \beta^{2}-38 \alpha \beta-1
\end{array}\right\}
$$

Thus (19) and (24) represent the non-zero distinct integer solutions to (1).

## METHOD 4:

One may write (3) as

$$
\begin{equation*}
\mathrm{U}^{2}+15 \mathrm{v}^{2}=31 \mathrm{z}^{2} * 1 \tag{25}
\end{equation*}
$$

Write 1 as

$$
\begin{equation*}
1=\frac{(1+i \sqrt{15})(1-i \sqrt{15})}{16} \tag{26}
\end{equation*}
$$

Substituting (19), (20) and (26) in (25) and employing the factorization method, define

$$
(\mathrm{U}+\mathrm{i} \sqrt{15} \mathrm{v})=(4+\mathrm{i} \sqrt{15})(\alpha+\mathrm{i} \sqrt{15} \beta)^{2} * \frac{(1+\mathrm{i} \sqrt{15})}{4}
$$

On equating the real and imaginary parts, we have

$$
\mathrm{U}=\frac{1}{4}\left(-11 \alpha^{2}+165 \beta^{2}-150 \alpha \beta\right)
$$

$$
\begin{equation*}
\mathrm{v}=\frac{1}{4}\left(5 \alpha^{2}-75 \beta^{2}-22 \alpha \beta\right) \tag{27}
\end{equation*}
$$

Using (27) in (4) we have

$$
\mathrm{u}=\frac{1}{4}\left(-11 \alpha^{2}+165 \beta^{2}-150 \alpha \beta-4\right)
$$

(29)

Using (28) and (29) in (2) we have

$$
\left.\begin{array}{l}
\mathrm{x}=\frac{1}{4}\left(-6 \alpha^{2}+90 \beta^{2}-172 \alpha \beta-4\right) \\
\mathrm{y}=\frac{1}{4}\left(-16 \alpha^{2}+240 \beta^{2}-128 \alpha \beta-4\right) \tag{30}
\end{array}\right\}
$$

Thus (19) and (30) represent the non-zero distinct integer solutions to (1) when replacing $\alpha$ by $2 \alpha$ and $\beta$ by $2 \beta$.

## NOTE:

It is worth mentioning here that in addition to (26), 1 may be represented as below:
(ii) $\quad 1=\frac{(7+i 4 \sqrt{15})(7-\mathrm{i} 4 \sqrt{15})}{289}$
(iii)
(iv) $\quad 1=\frac{(7+\mathrm{i} 12 \sqrt{15})(7-\mathrm{i} 12 \sqrt{15})}{2209}$

Following the procedure presented as above, for simplicity and brevity, we present below the integer solutions to (1) for (i) to (iv).
Solutions for (i):
$x=4\left(3 \alpha^{2}-45 \beta^{2}-38 \alpha \beta\right)-1$
$y=\alpha^{2}-15 \beta^{2}-178 \alpha \beta-1$
$\mathrm{z}=4\left(\alpha^{2}+15 \beta^{2}\right)$
Solutions for (ii):
$x=17\left(-9 \alpha^{2}+135 \beta^{2}-754 \alpha \beta\right)-1$
$y=17\left(-55 \alpha^{2}+825 \beta^{2}-626 \alpha \beta\right)-1$
$z=17^{2}\left(\alpha^{2}+15 \beta^{2}\right)$
Solutions for (iii):
$x=31\left(-83 \alpha^{2}+1245 \beta^{2}-1222 \alpha \beta\right)-1$
$y=31\left(-149 \alpha^{2}+2235 \beta^{2}-758 \alpha \beta\right)-1$
$z=31^{2}\left(\alpha^{2}+15 \beta^{2}\right)$
Solutions for (iv):
$x=47\left(-97 \alpha^{2}+1455 \beta^{2}-1954 \alpha \beta\right)-1$
$y=47\left(-207 \alpha^{2}+3105 \beta^{2}-1346 \alpha \beta\right)-1$
$z=47^{2}\left(\alpha^{2}+15 \beta^{2}\right)$

## III. CONCLUSION

To conclude, one may search for other patterns of solutions and their corresponding properties.
