#### Abstract

In this paper, we studied three new operations on bipolar fuzzy graph; namely direct product, semi strong product and strong product. Also, we give sufficient condition for each one of them to be complete. Regularity on some bipolar fuzzy graphs whose understanding crisp graphs are path on 2 m vertices, a cycle $\mathrm{C}_{\mathrm{n}}$ are studied with some membership functions.

## Keywords

Fuzzy Relation, Degree, Symmetric, bipolar fuzzy graph, Total Degree,Totally regular bipolar fuzzy graph, Induced sub graph, Complement, Crisp Graph

## PRELIMINARIES OF REGULAR BIPOLAR FUZZY GRAPHS

In this section, we first review some definitions of undirected graphs that are necessary for this paper

## Definition 1.1

By graph, we mean a pair $\mathrm{G}^{*}=(\mathrm{V}, \mathrm{E})$, where V is the set and E is a relation on V . The elements of $V$ are vertices of $G^{*}$ and the elements of $E$ are edges of $G^{*}$. We write $x y \in E$ to mean $\{x$ $y\} \in E$; and if $e=x y \in E$; we say $x$ and $y$ are adjacent. Formally, given a graph $\mathrm{G}^{*}=(\mathrm{V}, \mathrm{E})$, two vertices $x, y \in V$ are said to be neighbors, or adjacent nodes, if $x y \in E$ : The neighborhood of a vertex $v$ in a graph $G^{*}$ is the induced sub graph of $\mathrm{G}^{*}$ consisting of all vertices adjacent to v and all edges connecting two such vertices. The neighborhood is often denoted $\mathrm{N}(\mathrm{v})$.

## Definition 1.2

The degree deg (v) of vertex v is the number of edges incident on $v$ or equivalently, deg $(\mathrm{v})=|\mathrm{N}(\mathrm{v})|$. The set of neighbors, called a (open) neighborhood $\mathrm{N}(\mathrm{v})$ for a vertex v in a graph $\mathrm{G}^{*}$, consists of all vertices adjacent to v but not
including $v$, that is $N(v)=\{u \in V \mid v u \in E\}$ : When v is also included, it is called a closed neighborhood $\mathrm{N}[\mathrm{v}]$, that is, $\mathrm{N}[\mathrm{v}]=\mathrm{N}(\mathrm{v}) \cup\{\mathrm{v}\}$. A regular graph is a graph where each vertex has the same number of neighbors, i.e., all the vertices have the same open neighborhood degree.

## Definition 1.3

A complete graph is a simple graph in which every pair of distinct vertices is connected by an edge. An isomorphism of graphs $\mathrm{G}_{1}^{*}$ and $\mathrm{G}_{2}^{*}$ is a bijection between the vertex sets of $G_{1}^{*}$ and $G_{2}^{*}$ such that any two vertices $v_{1}$ and $v_{2}$ of $G_{1}^{*}$ are adjacent in $\mathrm{G}_{1}^{*}$ if and only if
$\mathrm{f}\left(\mathrm{v}_{1}\right)$ and $\mathrm{f}\left(\mathrm{v}_{2}\right)$ are adjacent in $\mathrm{G}_{2}^{*}$. Isomorphic graphs are denoted by $\mathrm{G}_{1}^{*} \simeq \mathrm{G}_{2}^{*}$.

## Definition 1.4

A fuzzy set $A$ on a set $X$ is characterized by a mapping $\mathrm{m}: \mathrm{X} \rightarrow[0,1]$, called the membership function. A fuzzy set is denoted as $\mathrm{A}=(\mathrm{X}, \mathrm{m})$. A fuzzy graph $\xi=(\mathrm{V}, \sigma, \mu)$ is
a non-empty set V together with a pair of functions $\sigma: \mathrm{V} \rightarrow[0,1]$ and $\mu: \mathrm{V} \times \mathrm{V} \rightarrow[0,1]$ such that for all $\mathrm{u}, \mathrm{v} \in \mathrm{V}, \mu(\mathrm{u}, \mathrm{v}) \leq \sigma(\mathrm{u}) \wedge \sigma(\mathrm{v})($ here $\mathrm{x} \wedge \mathrm{y}$ denotes the minimum of $x$ and $y$ ). Partial fuzzy sub graph $\xi^{\prime}=(\mathrm{V}, \tau, v)$ of $\xi$ is such that $\tau(\mathrm{v}) \leq \sigma(\mathrm{v})$ for all $\mathrm{v} \in \mathrm{V}$ and $\mu(\mathrm{u}, \mathrm{v}) \leq v(\mathrm{u}, \mathrm{v})$ for all $\mathrm{u}, \mathrm{v} \in \mathrm{V}$. Fuzzy sub graph $\xi^{\prime \prime}=\left(P, \sigma^{\prime}, \mu^{\prime}\right)$ of $\xi$ is such that $\mathrm{P} \subseteq \mathrm{V}, \sigma(\mathrm{u})=\sigma(\mathrm{u})$ for all $u \in P, \mu^{\prime}(u, v)=\mu(u, v)$ for all $u, v \in P$.

## Definition 1.5

A fuzzy graph is complete if $\mu(u, v)=\sigma$ (u) $\wedge \sigma$ (v) for all $u, v \in V$. The degree of vertex $u$ is $d(u)=\sum_{(u, v) \epsilon \xi} \mu(u, v)$. The minimum degree of $\xi$ is $\delta(\xi)=\wedge\{d(u) \mid u \in V\}$. The maximum degree of
$\xi$ is $\Delta(\xi)=V\{d(u) \mid u \in V\}$. The total degree of $a$ vertex $u \in V$ is $\operatorname{td}(u)=$
$\mathrm{d}(\mathrm{u})+\sigma(\mathrm{u})$.

## Definition 1.6

A fuzzy graph $\xi=(\mathrm{V}, \sigma, \mu)$ is said to be regular if $\mathrm{d}(\mathrm{v})=\mathrm{k}$, a positive real number, for all $v \in V$. If each vertex of $\xi$ has same total degree $k$, then $\xi$ is said to be a totally regular fuzzy graph.

## Regular Bipolar Fuzzy Line Graphs Definition 2.1

A bipolar fuzzy graph, we mean a pair $G$ $=(A, B)$ where $A=\left(\mu_{A}^{P}, \mu_{A}^{N}\right)$ is a bipolar fuzzy set in

V and $\mathrm{B}=\left(\mu_{\mathrm{B}}^{\mathrm{P}}, \mu_{\mathrm{B}}^{\mathrm{N}}\right)$ is bipolar relation on V such that $\mu_{\mathrm{B}}^{\mathrm{P}}(\{\mathrm{x}, \mathrm{y}\}) \leq \min \left(\mu_{\mathrm{A}}^{\mathrm{P}}(\mathrm{x}), \mu_{\mathrm{A}}^{\mathrm{P}}(\mathrm{y})\right)$ and $\mu_{\mathrm{B}}^{\mathrm{N}}(\{\mathrm{x}$, $y\}) \geq \max \left(\mu_{A}^{N}(x), \mu_{A}^{N}(y)\right)$ for all $\{x, y\} \in E$. We call A the bipolar fuzzy vertex set of $\mathrm{V}, \mathrm{B}$ the bipolar fuzzy edge set of $E$, respectively.
Note that B is a symmetric bipolar fuzzy relation on A . We use the notation x y for an element of E . Thus, $G=(A, B)$ is a bipolar graph of $G^{*}=(V, E)$ if $\mu_{\mathrm{B}}^{\mathrm{P}}(\mathrm{x}, \mathrm{y}) \leq \min \left(\mu_{\mathrm{A}}^{\mathrm{P}}(\mathrm{x}), \mu_{\mathrm{A}}^{\mathrm{P}}(\mathrm{y})\right)$ and $\mu_{\mathrm{B}}^{\mathrm{N}}(\mathrm{x}, \mathrm{y}) \geq \max$ ( $\left.\mu_{\mathrm{A}}^{\mathrm{N}}(\mathrm{x}), \mu_{\mathrm{A}}^{\mathrm{N}}(\mathrm{y})\right)$ for all $\mathrm{x} y \in \mathrm{E}$.

## Example 2.2

Consider the bipolar fuzzy graph,

## Definition 2.5

Let $G=(A, B)$ be a bipolar fuzzy graph. If each vertex of $G$ has same closed neighborhood degree $m$, then $G$ is called a totally regular bipolar fuzzy graph. The closed neighborhood degree of a vertex x is studied by $\operatorname{deg}[\mathrm{x}]=\left(\operatorname{deg}^{\mathrm{P}}[\mathrm{x}]\right.$, $\left.\operatorname{deg}^{\mathrm{N}}[\mathrm{x}]\right)$, where
$\operatorname{deg}^{P}[x]=\operatorname{deg}^{P}(x)+\mu_{A}^{P}(x)$,
$\operatorname{deg}^{N}[\mathrm{x}]=\operatorname{deg}^{\mathrm{N}}(\mathrm{x})+\mu_{\mathrm{A}}^{\mathrm{N}}(\mathrm{x})$,
We show with the following examples that there is no relationship between n-regular bipolar fuzzy graph and m-totally regular bipolar fuzzy graph.

## Example 2.6

Consider a graph $G^{*}$ such that $V=\{a, b$, $\mathrm{c}, \mathrm{d}\}, \mathrm{E}=\{\mathrm{ab}, \mathrm{bc}, \mathrm{cd}$, ad \} . Let A be a bipolar fuzzy subset of V and let B be a bipolar fuzzy subset of E studied by

|  | a | b | c | d |
| :--- | ---: | ---: | ---: | ---: |
| $\mu_{A}^{P}$ | 0.5 | 0.5 | 0.5 | 0.5 |
| $\mu_{A}^{N}$ | -0.3 | -0.3 | -0.3 | -0.3 |

|  | ab | bc | cd | da |
| ---: | ---: | ---: | ---: | ---: |
| $\mu_{B}^{P}$ | 0.2 | 0.4 | 0.2 | 0.4 |
| $\mu_{B}^{N}$ | -0.1 | -0.1 | -0.1 | -0.1 |

Routine computations show that a bipolar fuzzy graph G is both regular and totally regular.

## Definition 2.7

A bipolar fuzzy graph $G=(A, B)$ is called complete if

$$
\begin{aligned}
\mu_{\mathrm{B}}^{\mathrm{P}}(\mathrm{x} y) & =\min \left(\mu_{\mathrm{A}}^{\mathrm{P}}(\mathrm{x}), \mu_{\mathrm{A}}^{\mathrm{P}}(\mathrm{y}) \text { and } \mu_{\mathrm{B}}^{\mathrm{N}}(\mathrm{xy})\right. \\
& =\max \left(\mu_{\mathrm{A}}^{\mathrm{N}}(\mathrm{x}), \mu_{\mathrm{A}}^{\mathrm{N}}(\mathrm{y})\right) \text { for all } \mathrm{x}, \mathrm{y}
\end{aligned}
$$

$\in \mathrm{V}$.

## Example 2.8

Consider a graph $G^{*}$ such that $\mathrm{V}=\{\mathrm{x}, \mathrm{y}$, $\mathrm{z}\}, \mathrm{E}=\{\mathrm{xy}, \mathrm{yz}, \mathrm{zx}\}$. Let A be a bipolar fuzzy subset of $V$ and let $B$ be a bipolar fuzzy subset of $E$ studied by
$\mu_{A}^{P}(\mathrm{x})=0.5, \mu_{A}^{P}(\mathrm{y})=0.7, \mu_{A}^{P}(\mathrm{z})=0.6$,
$\mu_{A}^{N}(\mathrm{x})=-0.3, \mu_{A}^{N}(\mathrm{y})=-0.4, \mu_{A}^{N}(\mathrm{z})=-0.5$,
$\mu_{A}^{P}(\mathrm{xy})=0.5, \mu_{A}^{P}(\mathrm{yz})=0.6, \mu_{A}^{P}(\mathrm{zx})=0.5$,
$\mu_{A}^{N}(\mathrm{xy})=-0.3, \mu_{A}^{N}(\mathrm{yz})=-0.4, \mu_{A}^{N}(\mathrm{zx})=-0.3$,

G

Routine computations show that $G$ is a both complete and totally regular bipolar fuzzy graph,
but $G$ is not regular since $\operatorname{deg}(x) \neq \operatorname{deg}(z) \neq \operatorname{deg}$ (y).

## Theorem 2.9

Let $\mathrm{G}=(\mathrm{A}, \mathrm{B})$ be a bipolar fuzzy graph of a graph $\mathrm{G}^{*}$. Then $\mathrm{A}=\left(\mu_{A}^{P}, \mu_{A}^{N}\right)$ is a constant function if and only if the following are equivalent:
(a) $G$ is a regular bipolar fuzzy graph,
(b) G is a totally regular bipolar fuzzy graph.

## Proof:

Suppose that $\mathrm{A}=\left(\mu_{A}^{P}, \mu_{A}^{N}\right)$ is constant function. Let $\mu_{A}^{P}(\mathrm{x})=c_{1}$ and $\mu_{A}^{N}(x)=c_{2}$ for all x $\in \mathrm{V} .(\mathrm{a}) \Rightarrow(\mathrm{b})$ : assume that G is n -regular bipolar fuzzy graph, then $\operatorname{deg}^{P}(\mathrm{x})=n_{1}$ and $\operatorname{deg}^{N}(\mathrm{x})=n_{2}$ for all $\mathrm{x} \in \mathrm{V}$ :
So $\operatorname{deg}^{P}[x]=\operatorname{deg}^{P}(x)+\mu_{A}^{P}(x)$,
$\operatorname{deg}^{N}[x]=\operatorname{deg}^{N}(x)+\mu_{A}^{N}(x)$. for all $\mathrm{x} \in \mathrm{V}$;
Thus $\operatorname{deg}^{P}[\mathrm{x}]=n_{1}+c_{1}, \operatorname{deg}^{N}(\mathrm{x})=n_{2}+c_{2}$ for all $x \in V$. Hence, $G$ is a totally regular bipolar fuzzy graph. (b) $\Rightarrow$ (a): suppose that $G$ is a totally regular bipolar fuzzy graph, then
$\operatorname{deg}^{P}[\mathrm{x}]=k_{1}, \operatorname{deg}^{N}[\mathrm{x}]=k_{2}$ for all $\mathrm{x} \in \mathrm{V}$
or $\operatorname{deg}^{P}(x)+\mu_{A}^{P}(x)=k_{1}, \operatorname{deg}^{N}(x)+\mu_{A}^{N}(x)=$ $k_{2}$ for all $\mathrm{x} \in \mathrm{V}$
or $\operatorname{deg}^{P}(x)+c_{1}=k_{1}, \operatorname{deg}^{N}(x)+c_{2}=k_{2}$ for all x $\in \mathrm{V}$
or $\operatorname{deg}^{P}(x)=k_{1}-c_{1}, \operatorname{deg}^{N}(x)=k_{2}-c_{2}$ for all $x \in V$.
Thus, $G$ is a regular bipolar fuzzy graph. Hence (a) and (b) are equivalent. The converse part is obvious.

## Proposition 2.10

If a bipolar fuzzy graph G is both regular and totally regular, then $\mathrm{A}=\left(\mu_{A}^{P}, \mu_{A}^{N}\right)$ is constant function.

## Proof:

Let $G$ be a regular and totally regular bipolar fuzzy graph, then $\operatorname{deg}^{P}(\mathrm{x})=n_{1}, \operatorname{deg}^{N}(\mathrm{x})=$ $n_{2}$ for all $\mathrm{x} \in \mathrm{V}, \operatorname{deg}^{P}[\mathrm{x}]=k_{1}, \operatorname{deg}^{N}[\mathrm{x}]=k_{2}$ for all $\mathrm{x} \in \mathrm{V}$, Now $\operatorname{deg}^{P}[\mathrm{x}]=k_{1}, \Leftrightarrow \operatorname{deg}^{P}(x)+$ $\mu_{A}^{P}(x)=k_{1}, \Leftrightarrow n_{1}+\mu_{A}^{P}(x)=k_{1}, \Leftrightarrow \mu_{A}^{P}(x)=$ $k_{1}-n_{1}$ for all $\mathrm{x} \in \mathrm{V}$, Likewise, $\mu_{A}^{N}(x)=k_{2}-n_{2}$ for all $\mathrm{x} \in \mathrm{V}$, Hence $\mathrm{A}=\left(\mu_{A}^{P}, \mu_{A}^{N}\right)$ is constant function.
Remark The converse may not be true, in general. We state the following Theorem without its proof.

## Bipolar fuzzy line graphs

## Definition 3.1

Let $\mathrm{P}(\mathrm{S})=(\mathrm{S}, \mathrm{T})$ be an intersection graph of a simple graph $\mathrm{G}^{*}=(\mathrm{V}, \mathrm{E})$. Let $\mathrm{G}=\left(A_{1}, B_{1}\right)$ be a bipolar fuzzy graph of $\mathrm{G}^{*}$. We studied a bipolar fuzzy intersection graph
$\mathrm{P}(\mathrm{G})=\left(A_{2}, B_{2}\right)$ of $\mathrm{P}(\mathrm{S})$ as follows:
(1) $A_{2}, B_{2}$ are bipolar fuzzy sets of S and T , respectively,
(2) $\mu_{A 2}^{P}\left(S_{i}\right)=\mu_{B 1}^{P}\left(v_{i}\right), \mu_{A 2}^{N}\left(S_{i}\right)=\mu_{B 1}^{N}\left(v_{i}\right)$,
(3) $\mu_{B 2}^{P}\left(S_{i}, S_{j}\right)=\mu_{B 1}^{P}\left(v_{i}, v_{j}\right), \mu_{B 2}^{N}\left(S_{i}, S_{j}\right)=$ $\mu_{B 1}^{N}\left(v_{i}, v_{j}\right)$,
for all $\mathrm{Si}, \mathrm{Sj} \in \mathrm{S}, \mathrm{S}, \mathrm{Si}, \mathrm{Sj} \in \mathrm{T}$. That is, any bipolar fuzzy graph of $\mathrm{P}(\mathrm{S})$ is called a bipolar fuzzy intersection graph. The following Proposition is obvious.

## Proposition 3.2

Let $\mathrm{G}=\left(A_{1}, B_{1}\right)$ be a bipolar fuzzy graph of $\mathrm{G}^{*}$, then

- $\mathrm{P}(\mathrm{G})=\left(A_{2}, B_{2}\right)$ is a bipolar fuzzy graph of $\mathrm{P}(\mathrm{S})$,
- $\mathrm{G} \simeq \mathrm{P}(\mathrm{G})$.

This Proposition shows that any bipolar fuzzy graph is isomorphic to a bipolar fuzzy intersection graph.

## Definition 3.3

Let $L\left(G^{*}\right)=(Z, W)$ be a line graph of a simple graph $\mathrm{G}^{*}=(\mathrm{V}, \mathrm{E})$.
Let $\mathrm{G}=\left(A_{1}, B_{1}\right)$ be a bipolar fuzzy graph of $\mathrm{G}^{*}$. We studied a bipolar fuzzy line graph
$\mathrm{L}(\mathrm{G})=\left(A_{2}, B_{2}\right)$ of G as follows,
(1) $A_{2}$ and $B_{2}$ are bipolar fuzzy sets of Z and W , respectively,
(2) $\mu_{A 2}^{P}\left(S_{x}\right)=\mu_{B 1}^{P}(x)=\mu_{B 1}^{P}\left(u_{x}, v_{x}\right)$
(3) $\mu_{A 2}^{N}\left(S_{x}\right)=\mu_{B 1}^{N}(x)=\mu_{B 1}^{N}\left(u_{x}, v_{x}\right)$
(4) $\mu_{B 2}^{P}\left(S_{x} S_{y}\right)=\min \left(\mu_{B 1}^{P}(\mathrm{x}), \mu_{B 1}^{P}(\mathrm{y})\right)$
(5) $\mu_{B 2}^{N}\left(S_{x} S_{y}\right)=\max \left(\mu_{B 1}^{N}(\mathrm{x}), \mu_{B 1}^{N}(\mathrm{y})\right)$, for all $S_{x} S_{y} \in \mathrm{Z}, S_{x}, S_{y} \in \mathrm{~W}$.

## Example 3.4

Consider a graph $G^{*}=(V, E)$ such that $V$ $=\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \mathrm{v}_{3}, \mathrm{v}_{4}\right\}$ and $\mathrm{E}=\left\{\mathrm{x}_{1}=\mathrm{v}_{1} \mathrm{v}_{2}, \mathrm{x}_{2}=\mathrm{v}_{2} \mathrm{v}_{3}\right.$, $\left.\mathrm{x}_{3}=\mathrm{v}_{3} \mathrm{v}_{4}, \mathrm{x}_{4}=\mathrm{v}_{4} \mathrm{v}_{1}\right\}$. Let $A_{1}$ be a bipolar fuzzy subset of $V$ and let $B_{1}$ be a bipolar fuzzy subset of E studied by

|  | $v_{1}$ | $v_{2}$ | $v_{3}$ | $v_{4}$ |
| :--- | ---: | ---: | ---: | ---: |
| $\mu_{A_{1}}^{P}$ | 0.2 | 0.3 | 0.4 | 0.2 |
| $\mu_{A_{1}}^{N}$ | -0.5 | -0.4 | -0.5 | -0.3 |

|  |  |  |  |  |
| :--- | ---: | ---: | ---: | ---: |
|  | $x_{1}$ | $x_{2}$ | $x_{3}$ | $x_{4}$ |
| $\mu_{B_{1}}^{P}$ | 0.1 | 0.2 | 0.1 | 0.1 |
| $\mu_{B_{1}}^{N}$ | -0.2 | -0.3 | -0.2 | -0.2 |

By routine computations, it is easy to see that $G$ is a bipolar fuzzy graph.
Consider a line graph $\mathrm{L}\left(\mathrm{G}^{*}\right)=(\mathrm{z}$, w) such that $\mathrm{Z}=$ $\left\{S_{x 1}, S_{x 2}, S_{x 3}, S_{x 4}\right\}$ and W $=\left\{S_{x 1} S_{x 2}, S_{x 2} S_{x 3}\right.$, $\left.S_{x 3} S_{x 4}, S_{x 4} S_{x 1}\right\}$ Let $\mathrm{A}_{2}=\left(\mu_{A 2}^{P}, \mu_{A 2}^{N}\right)$ and $\mathrm{B}_{2}=$ $\left(\mu_{B 2}^{P}, \mu_{B 2}^{N}\right)$ be bipolar fuzzy sets of Z and W , respectively. Then, by routine computations, we have
$\mu_{A 2}^{P}\left(S_{x 1}\right)=0.1, \mu_{A 2}^{P}\left(S_{x 2}\right)=0.2, \mu_{A 2}^{P}\left(S_{x 3}\right)=0.1$, $\mu_{A 2}^{P}\left(S_{x 4}\right)=0.1$,
$\mu_{A 2}^{N}\left(S_{x 1}\right)=-0.2, \mu_{A 2}^{N}\left(S_{x 2}\right)=-0.3, \mu_{A 2}^{N}\left(S_{x 3}\right)=-0.2$
, $\mu_{A 2}^{N}\left(S_{x 4}\right)=-0.2$,
$\mu_{B 2}^{P}\left(S_{x 1} S_{x 2}\right)=0.1, \mu_{B 2}^{P}\left(S_{x 2} S_{x 3}\right)=0.1$,
$\mu_{B 2}^{P}\left(S_{x 3} S_{x 4}\right)=0.1, \mu_{B 2}^{P}\left(S_{x 4} S_{x 1}\right)=0.1$,
$\mu_{B 2}^{N}\left(S_{x 1} S_{x 2}\right)=-0.2, \mu_{B 2}^{N}\left(S_{x 2} S_{x 3}\right)=-0.2$,
$\mu_{B 2}^{N}\left(S_{x 3} S_{x 4}\right)=-0.2, \mu_{B 2}^{N}\left(S_{x 4} S_{x 1}\right)=-0.2$,

By routine computations, it is clear that $L(G)$ is a bipolar fuzzy line graph. it is neither regular bipolar fuzzy line graph nor totally regular bipolar fuzzy line graph.

## Proposition 3.5

If $L(G)$ is a bipolar fuzzy line graph of bipolar fuzzy graph $G$. Then $L\left(\mathrm{G}^{*}\right)$ is the line graph of G*.

## Proof:

Since $\mathrm{G}=\left(A_{1}, B_{1}\right)$ is a bipolar fuzzy graph and $\mathrm{L}(\mathrm{G})$ is a bipolar fuzzy line graph, $\mu_{A 1}^{P}\left(S_{x}\right)=\mu_{B 1}^{P}(x), \mu_{A 1}^{N}\left(S_{x}\right)=\mu_{B 1}^{N}(x)$ for all $\mathrm{x} \in E$.
And so $S_{x} \in Z \Leftrightarrow \mathrm{x} \in \mathrm{E}$. also $\mu_{B 2}^{P}\left(S_{x} S_{y}\right)=\min$ $\left(\mu_{B 1}^{P}(\mathrm{x}), \mu_{B 1}^{P}(\mathrm{y})\right), \mu_{B 2}^{N}\left(S_{x} S_{y}\right)=\max \left(\mu_{B 1}^{N}(\mathrm{x}), \mu_{B 1}^{N}(\mathrm{y})\right)$ for all $S_{x} S_{y} \in \mathrm{Z}$, and so $\mathrm{W}=\left\{S_{x} S_{y} \mid S_{x} \cap S_{y} \neq \emptyset\right.$, $\mathrm{x}, \mathrm{y} \in \mathrm{E}, \mathrm{x} \neq y\}$.
This completes the proof.

## Proposition 3.6

$\mathrm{L}(\mathrm{G})$ is a bipolar fuzzy line graph of some bipolar fuzzy graph G if and only if $\mu_{B 2}^{P}\left(S_{x} S_{y}\right)=$ $\min \left(\mu_{A 2}^{P}\left(S_{x}\right), \mu_{A 2}^{P}\left(S_{y}\right)\right)$ for all $S_{x} S_{y} \in \mathrm{~W}$, $\mu_{B 2}^{N}\left(S_{x} S_{y}\right)=\max \left(\mu_{A 2}^{N}\left(S_{x}\right), \mu_{A 2}^{N}\left(S_{y}\right)\right)$ for all $S_{x} S_{y}$ $\in \mathrm{W}$

## Proof:

Assume that $\mu_{B 2}^{P}\left(S_{x} S_{y}\right)=\min \left(\mu_{A 2}^{P}\left(S_{x}\right)\right.$, $\left.\mu_{A 2}^{P}\left(S_{y}\right)\right)$ for all $S_{x} S_{y} \in \mathrm{~W}$,
We studied $\mu_{A 1}^{P}(x)=\mu_{A 2}^{P}\left(S_{x}\right)$ for all $x \in \mathrm{E}$, Then $\mu_{B 2}^{P}\left(S_{x} S_{y}\right)=\min \left(\mu_{A 2}^{P}\left(S_{x}\right), \mu_{A 2}^{P}\left(S_{y}\right)\right)=\min$ $\left(\mu_{A 1}^{P}(x), \mu_{A 1}^{P}(y)\right)$,
$\mu_{B 2}^{N}\left(S_{x} S_{y}\right)=\max \left(\mu_{A 2}^{N}\left(S_{x}\right), \mu_{A 2}^{N}\left(S_{y}\right)\right)=\max$ $\left(\mu_{A 1}^{N}(\mathrm{x}), \mu_{A 1}^{N}(\mathrm{y})\right)$.
A bipolar fuzzy set $\mathrm{A}_{1}=\left(\mu_{\mathrm{A} 1}^{\mathrm{P}}, \mu_{\mathrm{A} 1}^{\mathrm{N}}\right)$ that yields that the property
$\mu_{\mathrm{B} 1}^{\mathrm{P}}(\mathrm{xy}) \leq \min \left(\mu_{\mathrm{A} 1}^{\mathrm{P}}(\mathrm{x}), \mu_{\mathrm{A} 1}^{\mathrm{P}}(\mathrm{y})\right)$,
$\mu_{\mathrm{B} 1}^{\mathrm{N}}(\mathrm{xy}) \geq \max \left(\mu_{\mathrm{A} 1}^{\mathrm{N}}(\mathrm{x}), \mu_{\mathrm{A} 1}^{\mathrm{N}}(\mathrm{y})\right)$
will suffice. The converse part is obvious.
