ABSTRACT

A dividend's value is determined on a per-share basis and is to be paid equally to all shareholders of the same class (common, preferred, etc.). The payment must be approved by the Board of Directors. So, to tackle the issue people with the same idea come together and pool their resources and knowledge in growing the business and distribute the profit among themselves which is earned through the business. When a part of the profit is distributed among the investors of the company is known as "Dividend". In general dividend is paid once in a year to the investors according to their investments made in the company. Dividend is one of the ways where the investors can make money out of their investments. The shareholder is eligible for dividend as long as their money is invested in the company and the company is making profits out of its business. This paper explains about Share price Volatility of Sree Cement before and after announcement using Arch Model.

Keywords: Share Price Volatility, Dividend Announcement, Arch & Garch Models.

JEL Codes: G10, G11, G12, G13, G14, G15.

I. INTRODUCTION:

Every company when it goes public, they have to be clear about their dividend policy. Dividend policy includes all the detailed information about how the company is going to treat its profits and the way of giving the dividend, in what time that they are going to pay dividend, how

much they are going to pay, procedures followed for dividend decision, etc.

Types of Dividends:

- ❖ **Cash** – this is the payment of actual cash from the company directly to the shareholders and is the most common type of payment. The payment is usually made electronically (wire transfer), but may also be paid by check or cash.
- ❖ **Stock** – stock dividends are paid out to shareholders by issuing new shares in the company. These are paid out pro-rata, based on the number of shares the investor already owns.
- ❖ **Assets** – a company is not limited to paying distributions to its shareholders in the form of cash or shares. A company may also pay out other assets such as investment securities, physical assets, and real estate, although this is not a common practice.
- ❖ **Special** – a special dividend is one that's paid outside of a company's regular policy (i.e., quarterly, annual, etc.). It is usually the result of having excess cash on hand for one reason or another.
- ❖ **Common** – this refers to the class of shareholders (i.e., common shareholders), not what's actually being received as payment.
- ❖ **Preferred** – this also refers to the class of shareholders receiving the payment.
- ❖ **Other** – other, less common, types of financial assets can be paid out as dividends, such as options, warrants, shares in a new spin-out company, etc.

Types of Dividend Policies:

Regular Dividend Policy:

This is one of the types of the dividend policy that the company can adopt for treating its dividend decisions. Under regular dividend policy the company will pay the part of the profit to its investors. Under this policy the amount that the investors are going to get not sure. Sometimes it can be more and sometimes it can very less. It all depends on the performance of the for that year and the profits that it has made by doing the business.

Stable Dividend Policy:

Under this type of dividend policy, the company is bound and promises to pay dividends to its investors of its profits. Under stable dividend policy, the investors are going to get dividend in the regular intervals as decided by the company. The investors of the company which follows stable dividend policy will get a fixed amount of dividend with no relation to how much the profits that the company is making. Investors will be getting a fixed amount every time when the company issues dividend.

Irregular Dividend Policy:

As the name say the companies which follows the irregular dividend policy pays their investors irregularly. The dividend decision is taken by the company in the Annual General Meeting (AGM) whether to give dividend or to retain the profits. Companies which follow this policy will mutually discuss and take decision regarding the payment of dividends. One year they may give dividend and in the other year they may not provide the dividend. The company focuses on the wealth maximization of the investors than the short-term gain that they make on the dividends.

No Dividend Policy:

Companies which follow no dividend policy will not issue dividend to its investors. That company will retain 100% of the profit and will utilize the money for future development and expansions. The only way that the investors are going to make money is the appreciation in the value of their investment.

II. REVIEW OF LITERATURE:

❖ **Atha Mbawa Jahfer, Abdul Hameed Mulafara (2016)** in the article “Dividend policy and share price volatility: Evidence from Colombo Stock market” published that the objective of this study is to examine the relationship between share price volatility and firm’s dividend policy on the Sri Lankan stock market listed in Colombo stock exchange for the period 2009–2013. The study is based on secondary data collected from various sources of relevant information and sample is 56

non-finance companies listed in Colombo stock exchange, Sri Lankan. They used mean, variance and standard deviation, correlation matrix ordinary least square regression model, multi regression models. Regression results indicate that there is a significant positive relationship between share price volatility and dividend policy of the firm. The dividend policy is relevant in determining share price changes in the Colombo stock market. According to regression results, size is significantly negatively related with price volatility, suggesting that the larger the firm, the less volatile the stock price.

❖ **Tuigong Wilson Kibet, Jagongo A. O, Ndede F.W. S (2016)** in the article “Objective of this study was to investigate the effect of dividend policy on the stock prices of firms listed at the Nairobi Securities Exchange for the period of 2001 and 2011. The study also compared both cash and share dividend and its effect on share price volatility of the companies. The study is based on secondary data and sample is 55 companies listed in Nairobi Securities Exchange. They have used ordinary Least Square diagnostic tests, Random Generalized Least Square regression analysis. Results of the study implied that dividend policy affects the share price and that increase in cash dividend would result in increase in share price for companies listed at the Nairobi Securities Exchange. The management of listed firms should consider adoption of cash dividend policy more than share dividend as a strategy aimed at increasing the value of the firms due to its positive effect on the share price.

❖ **Syed Akif Shah, Umara Noreen (2016)** in the article “Stock Price Volatility and Role of Dividend Policy: Empirical Evidence from Pakistan” published that this research endeavors to figure out the relationship between share price volatility and dividend policy of listed companies in Karachi Stock Exchange (KSE), Pakistan for the period of 2005-2012. The study is based on secondary data and sample is 50 non-finance consistent dividend paying companies listed in Karachi Stock Exchange (KSE), Pakistan. They have used : Multiple regressions analyses, least squares methods. The study concludes that there is significant negative relationship between share price volatility and dividend policy. It has been empirically proved that dividend policy has significant relationship with stock price volatilities and this relationship can either be positive or negative depending upon the financial and political system a country has.

❖ **Byson B. Majanga (2015)** in the article “The Dividend Effect on Stock Price-An Empirical

Analysis of Malawi Listed Companies” published that this paper aims at establishing if there exists such a direct relationship between a firm’s dividends and its stock price with particular emphasis on the Malawi Stock Exchange (MSE) for the period 2008 to 2014. The study is based on secondary data and the sample is 13 companies listed in Malawi Stock Exchange (MSE). The have used Descriptive statistics, correlation analysis. The study therefore establishes that on the Malawi Stock Exchange (MSE), there is a strong positive relationship between a firm’s dividends and its stock price on the stock market. The study further finds that stock price is an outcome of a number of factors, dividends being one of them and having a very significant contribution.

❖ **Anas Al Qudah, Aziz Yusuf (2015)** in the article “Stock Price Volatility and Dividend Policy in Jordanian Firms” published that This study examines the relationship between stock prices and dividend policy. The model developed for this research evaluates the relationship between dividend policy and stock price volatility over a span of ten years. It is based on secondary data and the sample is 400 companies listed in Amman Stock Exchange. All of the data chosen for this research was obtained from the Amman Stock Exchange (ASE) over the periods 2001 -2011. The study uses multiple least square regressions, Pearson correlation analysis for its analysis. Results shows that there is a positive relation between the share price volatility and the dividend yield. The results also demonstrated that higher payout ratios would mean low volatility of the stock price. The concluded by saying that the company managers at the Jordanian industrial firms need to affect their firms’ share prices by taking into consideration the dividend policy that is attractive to their targets investors.

❖ **Fawaz Khalid Al-Shawawreh (2014)** in his article “The Impact of Dividend Policy on Share Price Volatility: Empirical Evidence from Jordanian Stock Market” published that the purpose of this study was to examine the relationship between dividend policy and share price volatility of companies listed in Jordanian stock market, Hong Kong. The data is based on secondary data and sample is 53 companies listed in Jordanian stock market, Hong Kong. They have used Correlation Analysis, linear regression analysis in the study. The study found that dividend payout and stock dividend have most impact on share price volatility. The dividend policy of the companies is going to have impact on share price volatility.

❖ **Yasir Habib, Zernigah Irshad Kiani & Muhammad Arif Khan (2012)** in the article

“Dividend Policy and Share Price Volatility: Evidence from Pakistan” published that the main purpose of this study is to find out the role of dividend policy i.e., dividend yield on share price changes in the long run in Pakistan. The companies that are included in the study are non-financial firms listed in Karachi Stock Exchange 100 index. It is based on secondary data and the sample is companies listed in Karachi Stock Exchange 100 index. They have used cross sectional regression analysis, mean, median and standard deviation. The regression results showed that relationship of share volatility with dividend yield is positive. The study found that issuing of dividend has a positive impact on share volatility in the market and issuing of dividend leads to increase in share price of the company in the stock market.

❖ **Khaled Hussainey, Chijoke Oscar Mgbame, Aruoriwo M. Chijoke-Mgbame (2011)** in the article “Dividend policy and share price volatility: UK evidence” published that the purpose of this study is to examine the relation between dividend policy and share price changes in the UK stock market. It is based on secondary data and sample is public companies listed in London Stock Exchange. Correlation and Multiple regression analysis is used to explore the association between share price changes, both dividend yield and dividend payout ratio. A positive relation is found between dividend yield and stock price changes, and a negative relation between dividend payout ratio and stock price changes. In addition, it is shown that a firm’s growth rate, debt level, size and earnings explain stock price changes.

❖ **Dr. J. J. Adefila, Dr. J. A. Oladipo and J.O Adeoti (2004)** in the article “The Effect of Dividend Policy on the Market Price of Shares in Nigeria: Case Study of Fifteen Quoted Companies” published that the objective of this study is to critically examine the possible effects that a firm’s dividend policy might have on the market price of its common stock and also, those factors that influence firm’s dividend policy in general of quoted companies in Nigeria. data is based on secondary data and sample is 15 selected companies from Nigeria stock exchange. In this study Person’s Movement Correlation is been used. The study found that there is no significant relation between dividends and share prices. Share prices of Nigerian firms are fixed and regulated by the Securities and Exchange Commission (SEC) for quoted companies only. Most Nigerians buy and own shares for prestigious reasons aimed at boosting their egos and not for speculative reason.

❖ **Radhe Shyam Pradhan (2003)** in the article “Effects of Dividends on Common Stock

Prices: The Nepalese Evidence” published that this paper examined the valuation of firms whose shares are traded in the Nepalese stock market. it attempts to determine relative importance of dividends and retained earnings in determining market price of share. The study aimed on knowing the effect of issuing dividend against retained earnings. The study is based on secondary data collected from various sources. The sample is 29 companies that are listed in Nepal Stock Exchange. The study has used linear and logarithmic forms, Regression, continuous cross-section techniques. The results of the study show the customary strong dividend and very weak retained earnings effect. Nepalese investors are more attractive towards dividends than the retained earnings. Found that dividends have a predominant influence on stock prices. The study concluded that Nepalese stock market has not started recognizing the impact of retained earnings.

III. STATEMENT OF THE PROBLEM:

In this paper, the date of dividend announcement is defined as day 0 or event day. If event day is a non-trading day, then the immediately following trading day is considered as an event day. Pre-announcement period includes 15 trading days prior to the dividend announcement date, i.e., days -15 to -1. Post announcement period includes 15 trading days after the dividend announcement i.e., days +1 to +15. Thus, we have taken the event window of 31 trading days (including day 0 as the event day). The estimated abnormal returns are averaged across securities to calculate Average Abnormal Returns (AARs) and average abnormal returns are then cumulated over time in order to ascertain Cumulative Average Abnormal Returns (CAARs).

IV. OBJECTIVES OF THE STUDY:

- ❖ To study the Relationship of divided announcement on share price Shree Cement Company
- ❖ To study the Impact of pre and post dividend announcement on share price at Shree Cement Company
- ❖ To study stock/ share price volatility during pre and post dividend announcement by using ARCH family/ ARCH models

V. HYPOTHESES OF THE STUDY:

H0: There is no Relationship Between Divided and Share price in Shree Cement Company

H1: There is a Relationship Between Divided and Share price in Shree Cement Company

H0: There is no Impact of pre and post dividend announcement on share price in Shree Cement Company

H1: There is a Impact of pre and post dividend announcement on share price in Shree Cement Company

H0: There is no volatility of pre and post dividend announcement on share price in Shree Cement Company.

H1: There is no volatility of pre and post dividend announcement on share price in Shree Cement Company

VI. RESEARCH METHODOLOGY:

❖ **Sources of Data:** The secondary data were obtained from the annual reports of the ten public sector banks. Additional data for analysis and verification were sourced from www.moneycontrol.com. The data were subjected to certain fundamental mathematical operations such as computing the ratios, before being used for the analysis.

❖ **Research tools:**

- Correlation,
- Regression
- Descriptive Statistics
- Stationary test
- Regression Analysis
- Arch and Garch Models.

VII. Scope of the Study:

❖ The study covers the basic meaning, types, theories and concepts of Dividends, share price volatility and ARCH models.

❖ The study is restricted to consider only the share prices of the stocks on dividend announcement day.

❖ The study is confined to 10 selected cement industries which are listed in National Stock Exchange.

❖ The study period consists of 10 years, i.e., 2012-2021.

VIII. NEED FOR THE STUDY:

Dividend policy is one of broad researched topics in the field of finance, but the question is whether dividend policy affects stock prices still remain questionable among researchers, managers and policy makers. Dividend policy is important for managers, lenders and for other stakeholders. It is also important for investors because they consider dividends not only the source of income but also a way to evaluate the firms from investment points of view stated by Al-Masum (2014) and Rossi (2015)..

IX. LIMITATIONS OF THE STUDY:

- ❖ The study is limited only to selected cement industries.
- ❖ Focusses only on 10 selected cement industries rather than all cement industries.
- ❖ This study included data only form 2012-2021 and not anything beyond.
- ❖ The data used for the study are secondary. So, there is a chance that data may have lack of accuracy.
- ❖ The study is based on secondary data available from money control, yahoo finance and screener websites.

X. RESULT AND DISCUSSION:

Table Shown Correlations of Shree Cement Company from2016-17 to 2020-2021.

Year	Dividend in Rs. (X)	dx=X-A	dx2	Share price on announcement day (Y)	dy=Y-A	dy2	dxdy

Durbin-Watson stat	1.980900			

Result and Discussion:

Above Table shows Indicates Arch Model of Shree Cement for the period of 5 Months and This time I identified Stock Volatility on Russian and Ukraine war. It is Observed the Coefficient Values are 59.97220 and 0.931752. Arch Model applied in the Sun Pharma is Durbin-Watson is for Linearity is 1.980900 and also applied Akaike info criterion for stationarity is 8.072295. The R-squared Value is 0.907214 for check the Volatility of stocks in this Period. The Hannan-Quinn information criterion (HQC) is a measure of the goodness of fit of a statistical model, and is often used as a criterion for model selection among a finite set of models is 8.117378. The Schwarz Criterion is an index to help quantify and choose the least complex probability model among multiple options is observed 8.184144. Final the model fitted. The standard error of the regression (S), also known as the standard error of the estimate, represents the average distance that the observed values fall from the regression is 13.37331.

Finally, the research study would be useful to the investors and will serve as a **guide for their future investments**. The attentions of the **investors are focused on the impact of dividend announcements** on share prices so that they can take a rational decision on their investment. The study would be a handy guide to the investors to choose the **timing of their investment**. It would also be useful to the management of the companies in formulating their dividend policy. This study makes a number of contributions to the impact of dividend announcement on share price among the selected companies in cement industry during the study period. The results of paired t-test analysis shows that the dividend do not affect the share prices, i.e., there is no significant change in the share prices after announcing dividend in all the three pairs. High-low share price indicator of Cement Industry exhibits that none of the pairs had found significant difference of mean value during the study period.
