Date of Acceptance: 20-12-2024

ABSTRACT: This paper tries to apply astrology in the January 2025 sentiment and trend forecast of the Chinese A-share market. Based on the chart for January 1st, 2025, with the zodiac, positions of planets, and their aspects-such as conjunctions, squares, and trines-the research reveals the pattern of the influence of astronomical events like full moons and new moons on the volatility of the market. Therefore, through various observations that involve both systematic analysis and visualization of data, the study finds significant results on the association between aspects on the planet and market sentiments or industry performances. The surges in market sentiment over high-time cycles of full moon reveal extraordinary uptakes within the technology sector, with green energy at the front, while in formations of new moons, market sentiments fall, attracting buyers from sectors that are usually more steady, like infrastructure or finance. Capricorn phase indicates stability and conservatism, while innovative and growth-oriented is Aquarius. It would therefore seem that the symbolic astrological forecasts are highly correlated with the dynamics of market sentiment and could serve investors as a strong reference for optimizing their cyclic strategy: high-growth sector focus during full moons, shifting to steady investment during new moons in order to reach a dynamic balance between return and risk.

KEYWORDS: astrology, market sentiment, A-share market, planetary aspects, investment strategy

I. INTRODUCTION

In recent years, with the rising complexity and uncertainty of global financial markets,

investors are giving more and more attention to unconventional forecasting tools. Astrology, with its traditional methodology of forecasting, has again attracted wide attention. Especially in the study of market sentiment and volatility, it gives a very unique look at the dynamics of financial markets because of its symbolic and cyclic nature. Although there is a gradually increasing discussion on the possible linkage of astrology with economic cycles, market sentiment, and investment behavior, systematic and data-driven research is still scarce, and a research gap still exists, especially in the specific application to regional markets such as the A-share market in China. Using the astrological data of January 2025, this study is aimed at studying how the various astronomical events such as full moon, new moon, and the planetary phases like conjunctions and oppositions affect market sentiments and performances of industries considering the distinctive nature of the Chinese A-share market. It deeply analyzes both the astrological data and patterns of market reactions, which enables the study not only to fill in some gaps in the field but also to show the practical value of astrology in forecast strategy. The goal of the study is to provide new means of optimizing cyclical strategies by investors, data support, and a theoretical basis for using astrology in financial activities..

Purpose of the Study

This paper targets the application of astrology to predict the sentiment and volatility of China's A-share market in January 2025. Based on an analysis of the possible impact of the conjunction of stars and planets, such as full moon

and new moon, on the fluctuation of the market, this study reveals how the heaven's cycles influence the sentiment and sectoral performances of the market and gives references to investors for cyclic optimization of strategies, providing a reference for the application of astrology in the financial field. It also provides data support and theoretical basis for the application of astrology in the financial field.

Research Significance

This paper investigates the application of astrology in predicting sentiment and volatility in the Chinese A-share market to provide investors with a non-traditional decision support tool and to introduce new cyclical insights into market sentiment analysis. Theoretically, this paper systematizes the analytical framework of the relationship between symbolic forecasts of astrology and changes in financial market dynamics and fills in the gap of applying existing studies to regional markets. In practice, this paper uncovers the intrinsic pattern of astronomical events and industry performance, which can provide a basis for investors to optimize asset allocation and risk management strategies during market fluctuations. Furthermore, this paper extends the application scenarios of astrology in modern finance and offers new ideas for academics and practitioners to explore complex systems. By combining traditional philosophical methods with data analysis techniques, this paper is of great significance to promote academic innovation and guide practice.

Research Questions

Research Question 1: How do the astronomical events of full moon, new moon, and the structure of the astrolabe influence the overall sentiment and volatility within China's A-share market in January 2025?

Sub-question 1.1: To what extent, if at all, does the astrological structure - that is, planetary positions and aspects - on 1 January 2025 reflect the potential trend of the overall market sentiment?

Sub-question 1.2: How do the Full Moon, New Moon, and their phase changes lead to highs/lows within market sentiment?

Sub-question 1.3: Do astrological phases, such as Capricorn and Aquarius, have a significantly different impact on market sentiment and volatility?

Research Question 2: To what extent do the conjunctions and oppositions of planetary phases reflect market performances of selected sectors, such as technology, new energy, and infrastructure, among others? And what are the mechanisms?

Sub-question 2.1 Is there a significant statistical relationship between the planetary aspects of key pairs, as above and the corresponding industry investment opportunity score?

Sub-question 2.2: Whether the general impact of planets on the market is consistent or specific to industries.

Sub-question 2.3: How do planetary aspects, such as conjunctions and squares in combination, influence risks and opportunities within the various sectors of the market?

Research Question 3: Besides, can astrological symbolic forecasting give investors a valid reference for optimization by the cyclical strategy through different market phases?

Sub-question 3.1: How are investment preferences of the different sectors manifested during full and new moons?

Sub-question 3.2: How does the interaction of planetary aspects with the overall structure of the market help investors to pinpoint the key nodes of the market?

II. LITERATURE REVIEW

Astrology is a traditional, philosophical forecasting approach that adheres to the laws of celestial motions to unfurl the possible coincidence between human behaviors, societal events, and natural occurrence via the position of and changes in planetary cycles. At their historical and philosophical roots, the essence of astrology lies in mapping laws of macroscopic celestial bodies into microsocial and psychological activities that are carried out by a human, thereby forming a unique prognostication system based on symbolism and cycle analysis. It not only reflects long-term observation-based practices but also philosophizes thinking of human beings while struggling for pattern and meaning in systems with complex entities. Although astrology has nothing to do with a firm, strict natural science, what gives it an intrinsically harmonious place with modern science and the theory of complex systems is its emphasis on cyclic, holistic, and systemic nature.

Astrology and the Scientific Explanation of Market Volatility

Astrology depicts, through philosophical symbolic models, the market sentiment and volatility, and its association with the scientific method can be explained through modern frameworks like biological rhythms, psychological theories, and fuzzy logic. At the same time, it is notably important to examine the role astrology plays in non-causal correlations. The market-a complex dynamic system-similarly often behaves

nonlinearly with multifactor drives. Astrology begets a lens to scan these dynamics through cyclical analysis, and the study of non-causal correlations avoids analysis bias that may come when one mistakes correlation for causation. By understanding these non-causal correlations, hidden patterns can be illuminated, providing unique insights into the study and prediction of complex systems.

Astrology and its relevance to machine learning or deep learning

The theoretical and practical relevance of the predictive models of astrology to machine learning and deep learning methods in modern artificial intelligence are that both are united in inferring future events through the identification of data patterns, though with different means and goals. In the data-driven aspect, astrology draws on long-term observations of celestial motion to extract cyclical patterns and predict based on this, highly similar to the time-series analysis models in machine learning, such as ARIMA and LSTM, which predict future trends by analyzing historical data patterns. Nonlinear complexity processing: Astrology reflects the nonlinear effects of market sentiment through the phase relationships of planets, emphasizing holistic and systematic approaches. Deep learning, especially multi-layer neural networks, is good at capturing nonlinear relationships in high-dimensional spaces. For example, the Transformer model can be used for multi-dimensional prediction of dynamical systems, which is a high fit with astrology's need for multi-planetary interaction analysis. In addition, astrology is not an absolute causal description but a trend prediction based on "likelihood", which is consistent with the fuzzy logic approach. Fuzzy Neural Networks can combine the fuzzy rules of astrology with the computational power of machine learning to quantify fuzzy astrological logic into computable predictive models. Finally, strategy optimization in reinforcement learning inspires astrology. While reinforcement learning finds the optimal strategy by optimizing long-term returns in the environment, astrology tries to derive the best strategy for market fluctuations by analyzing long-term cyclical data. This similarity provides a scientific basis for integrating astrology and AI methods and expands the modern application scenarios of astrology.

Potential for Convergence of Astrology and Algorithmic Prediction

Core directions for convergence include data-driven astrology optimization, the

development of hybrid models, and human-computer collaboration. First, machine learning will be used to model the historical data of astrology and fluctuations in the market, deep learning models analyzing possible nonlinear relationships between certain phases of planets and market sentiment for more accurate predictive tools of the market. Meanwhile, Natural Language Processing methods will be introduced to transform the textual descriptions in astrology, such as the symbolism of planetary phases, into structured data for machine learning model training so that the models' explanatory power and application scope can be further enhanced. Then, hybrid predictive models such as using the phase of the planets as inputs to features and integrating them with fundamental data of the market for developing hybrid neural network models that can predict will be built. Furthermore, with the help of GANs, the simulation of possible astrological cycles, changes in market sentiment, and identification of possible risks and opportunities to inform investment decisions can be performed. Finally, in applications of human-computer collaborative astrology, the a priori knowledge of experts in astrology can be employed for the supervised learning models, while deep learning models optimize the prediction capability through automatic learning from data, thus providing an efficient prediction system for human-computer collaboration. This integration not only enhances the modern application of astrology but also opens up new paths for dynamic prediction and decision optimization of complex systems.

Scientific and Practical Value

The scientific nature of astrology as a philosophical forecasting tool is to reveal the underlying laws of periodicity and ambiguity in complex systems. Merging with modern scientific theories like biological rhythms, psychological theories, fuzzy logic, and chaos theories, a more scientific explanation can be provided for astrology's correlation with market fluctuations and emotions. Further introduction of machine learning and deep learning techniques can not only make up for the shortcomings of astrology in data analysis but also improve the accuracy and robustness of the predictions. Further, this convergence opens a possibility to modernize the application of astrology and also opens up new directions in the study of market behavior. Through scientifically integrating and innovating, astrology will evolve from a traditional philosophy tool to a useful tool in studying complex systems.

Historical Cases and the Science behind Astrology

Astrology has long been notorious for its attempts to predict certain major events, and here are a number of historical cases said to be evidence of correct predictions. For example, Michel de Nostredame, also known as Nostradamus, received credit for predicting major milestones such as Adolf Hitler becoming powerful and the 11th September attacks through his mystical verses. Bulgarian mystic Baba Vanga reportedly predicted events such as a submarine disaster in Kursk and the rise in power of ISIS, earning her a reputation for a high degree of prophetic accuracy. Another well-known example is when British astrologer RH Naylor predicted the R101 airship disaster in the year 1930 about a week before a major aviation accident took place. In addition is Michel Gauquelin's "Mars effect"-a hypothesis that showed by statistical correlation the position of the planet Mars at birth will relate to an individual's high athletic achievement. This sparked big debate about the scientific backbone of astrology.

Although astrology does not have enough experimental validation, just like natural science, it doesn't mean that the prediction structure of astrology is not tested in practice; rather, it indicates the lack of standard processes and case statistics for prediction and result testing in this respect. Its methodology does not rely on data-driven serious analysis-it displays a unique structured analysis capability through symbolic predictions. Based on the randomness of an entirely unknown field, astrology has developed its own pattern recognition methodology, which has a certain statistical significance. There exist some methodological parallels between the random sampling of statistics and the observation of changes in the heavenly bodies. Both seek to find patterns in the complexity of random variables that provide inspiration for further research. For example, when dealing with uncharted territory, many times science needs to accumulate a lot of data to support decisions, while through its symbolic framework, astrology suggests the hypothesis for the directions of delving, through pattern recognition and long-term generalisation in the face of lack of data. This ability can be applied to complex systems where explicit hypotheses have not yet been developed for scientific decision-making, thus providing a potential entry point for research at uncharted territories.

Science is itself a multidimensional system of investigation, encompassing natural and social sciences, technological studies, and more. Moreover, the purpose of science is not only to

verify and deny but to seek the laws of the unknown world. Science has to develop based on an open perspective with no direct denial of the being or non-being of some connection. As a matter of fact, a lot of scientists have their religious and philosophical beliefs, which again proved that there is not completely severed relationship between science and traditional culture and philosophical methods of prediction. Some scientists believe the far end of science might be theology. This view accentuated the intersection of science and philosophy, and the place where science does not just rely on physics and experimentation but was in need of a conceptual dialogue with tradition and philosophy. To this extent, astrology as one of the philosophical predictive means offers a complementary point of view on scientific research in its symbolism, the recognition of patterns, and the ability to investigate territories that have not been charted hitherto.

Astrology is one of the symbolic methods of forecasting, attempting to explain terrestrial events and human affairs based upon the positions and movements of celestial bodies. This is a method based on symbolism and pattern recognition rather than rigorous scientific experimentation and data analysis. According to Tompkins in her book *Contemporary Astrological Studies*, astrology maps human experience and events within the world with a system of symbolic language and sign systems. The symbolic foresight of astrology not only proved consistently prevalent through historical cultures but also holds insights into the statistical reasoning behind modern-day science. It constructed its own analytical structure through long-term observation, an approach which, although not strictly adhering to the scientific system of validation, at least complements the capability of systematic exploration based on randomness and pattern recognition. It has given direction where everything seems empty. Thus, this has allowed it to keep on not only as a tradition but may provide possibilities for serving as an aid to modern science as well. Hence, this is the point indicating that the value of astrology may lie not just in the preciseness of the predictions themselves, but rather in their own unique methodology of symbolic and stochastic analysis, thus serving as a complementary entity in the light of science and philosophy for exploring those aspects that are left unknown.

III. RESEARCH METHODOLOGY

It has something to say to prove astrology can function as one part of this triangle for making

a complementary financial prediction of market functions. Therefore, sentiment and volatility characteristics relevant to the A-share market for January 2025 would be accounted for, enhanced with elements drawn from data on various astronomic formations and processes by following up with coherent analytical-visualization procedure steps to illustrate just exactly that. Specific applications rest precisely on:

1. Object of the study

The object of this research is the major stock indices and related industry sectors, such as technology, new energy, and infrastructure, of China's A-share market during the period of January 2025. This will include research on market sentiment indices, trading volume volatility, and sector-specific returns. Meanwhile, key variables, including astronomical events and planetary phases, will be selected as the core factors in this analysis.

2 Means or methods

It attempts to build a time series model in which the positions and phases of planets within the zodiac are constructed from extracting the astronomical data through the plotting software of an astrolabe combined with market trading data. From this, it uses such statistical analysis methods as correlation analysis and regression modeling in order to quantify the relationship between the planetary aspects and market sentiment/volatility. Data visualization techniques include heat maps, graphs, and network diagrams for visualization of the potential pattern of influence of planetary aspects on sectorial performance.

3. Procedures

Data Collection: The needed astronomical data on the positions and phases of the planets and trading data containing sector returns and market volatility indices for the A-share market of China in January 2025.

Astrological Analysis: Plot daily astronomical charts through astrological software to depict main events and phase changes.

Data Integration and Analysis: Combine the data with respect to astronomical influences with data related to market trading, while analyzing the statistical relationship between such planetary aspects and market sentiment, volatility, and sector performances.

Visualization of results: Several visualization tools are used to show what the likely pattern of impact will be for astronomical events on market conditions, including some basic correlation analysis on sector performances.

Conclusion validation: The key findings from combining results across different sectors and time points will have to be used to validate the research hypotheses.

The above steps comprehensively reveal how, with the symbolic forecasting methodology of astrology, one can explain the possible influence mechanism of astronomical events and planetary phase on China's A-share market, and provide a new reference for the cyclic strategy optimization by investors.

IV.FINDINGS OF THE STUDY

4.1Astrological Chart Analysis for 1 January 2025

General Overview

The astrological chart refers to the distribution of planets in the zodiac and their aspect relationships at 1 January 2025, 12:00. The planets and aspects contained in the astrolabe are the most important keys to understand market trends.

Zodiac House Analysis

Major Houses:

Capricorn: The Sun, Mercury, and Pluto come together in Capricorn. Capricorn's energy underlines structural change and stability; this would therefore indicate that the market will favor long-term sound strategies.

Taurus: Jupiter in Taurus, along with Uranus, will continue to innovate into more traditional sectors like agriculture and finance.

Pisces: Saturn and Neptune-Pisces is a combination which stands for the uncertainty factor likely to influence the market sentiments.

Empty House Positions:

No major planets are noticed in the houses of Aries and Libra, indicating the weak influence in these areas.

Planets about aspects

1. Major Aspects:

Conjunction-green line:

Sun-Mercury: Develops the ability to communicate information and to make decisions, promotes activity on the markets.

Opposition (red line):

Sun-Moon:The emotional conflict and indecisiveness may translate into a shorter-term volatile market.

Mars-Neptune: action meets dreams, or a sense of market risk is triggered.

Trine (Trine, blue line):

Sun & Jupiter: Energy flow is smooth, and therefore, long-term growth would be possible. It

will also be more beneficial for the conservative industries.

Quincunx (Square, yellow line):

Venus-Saturn: tension between innovation and tradition, or leading to a division between technological and solid industries.

Sextile: Purple line

Moon & Jupiter: emotional yet positive manifestations can bring short-term optimism.

2.Characteristics of planetary distribution:

As three Planets are concentrated in the Capricorn, Taurus, and Pisces sectors of this chart, the thrust can only reasonably be expected in the sphere of

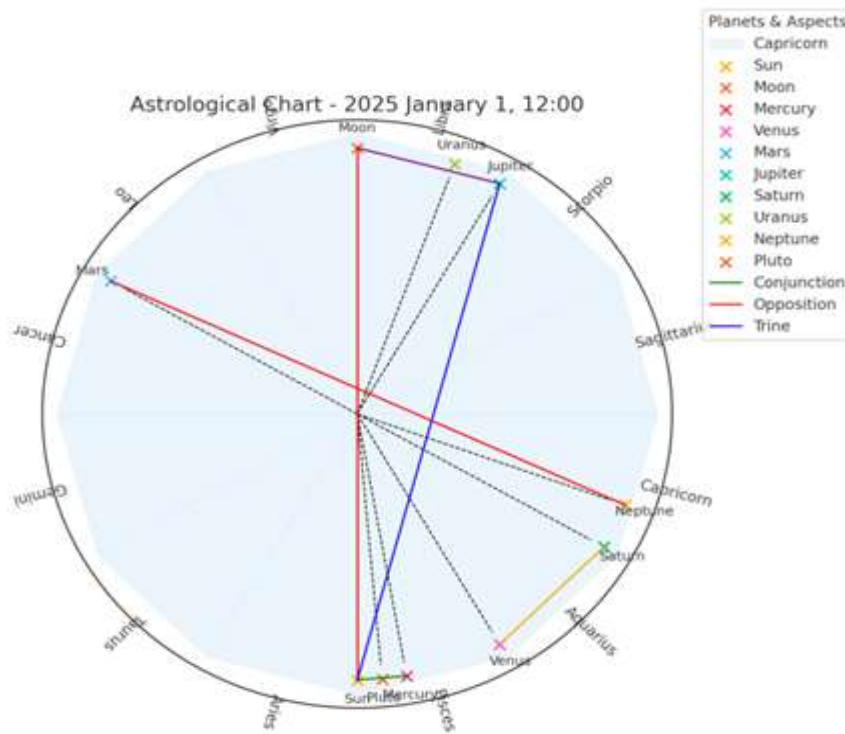

sound strategies, the innovative drivers, and then even more so the emotional driver behind all market participants.

Speculation on Market Trends

1. Short-term trends:

Market Volatility: Sun-Moon square may cause inconsistency in emotions and decision-making; hence, the market might see a jerk in the first part of the month.

Trading activity: Sun conjunction to Mercury accelerates information dissemination and therefore trading volume.

2. Long-term trend:

Solid growth: Sun-Jupiter trine signals better performance of long-term conservative investments, like infrastructure and resource-based industries.

The innovative drive, due to the combination of Uranus and Jupiter, enhances the potential to make technology merge with more traditional sectors.

3. Potential Dangers:

A combination of Saturn and Neptune may trigger policy and international market uncertainties; the impact of the external environment on the market should be watched.

Recommendations

Strategy for the Short Term: Use the Sun-Mercury conjunction to move into sectors of the chart that have your short-term focus-for example, financials and technology.

Medium- to long-term layout: accent on the innovative potential of Jupiter-Uranus and connected concentration of efforts in agriculture, energetic, and green economy industries.

Risk Control: Be careful about Saturn and Neptune variables and set cautious investment goals.

The above analyses give a complete interpretation of the market trends based on planetary positions and their aspects in the astrolabe.

4.2. Bar Chart Analysis - Impact on the Market by Constellations in January 2025

Overview of Chart Content

It gives us information about the name of the planets, like Sun, Moon, Mercury, etcetera on the horizontal axis and on a vertical axis, it shows the influence ratings on the market that is 110.

Color of the bar and rating are related to the degree of the planet's influence to the market:

Grey, blue green: neutral to positive influence.

Red: a potential negative or volatile influence.

Blue, green, yellow: neutral or positive, in different dimensions.

Data Insights

1. Positive Influence Planets (Rating > 7):

Sun:

A strong market driver, rated 8.

Predisposed to play a positive role in growth industries, whether technological or consumer goods.

Venus (Venus):

A huge positive market driver rated at 9.

It can be identified with a positive outlook in consumer, entertainment, or arts-related industries.

2. Neutral Influence Planets (Score 57):

Mercury (Mercury), Jupiter (Jupiter), Saturn (Saturn):

An average rating between 67 means stable and predictable performance in the market.

Areas that are suitable for long-term investment strategies, such as infrastructure or finance.

Uranus (Uranus), Neptune (Neptune):

Steady with innovation, driving specific industries, such as new energy and technology.

3. Negative or highly volatile planets (rating < 5):

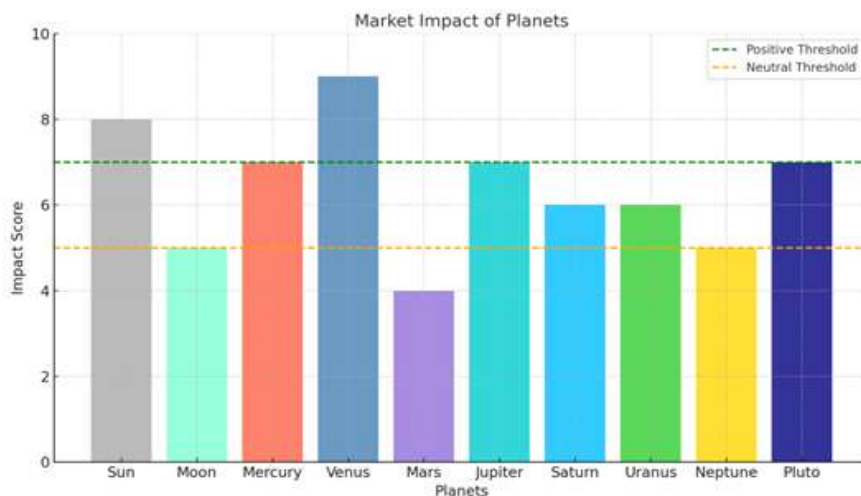

Mars:

A rating of 4 indicates a possible risk of uncertainty or volatility to the markets.

Or it may be associated with geopolitical or international events that require a cautious response.

Market Trends and Investment Recommendations

1. Short-term strategy

Focus on positive planets: the Sun and Venus are positive in the short term, focusing on investment opportunities related to consumer upgrades and emerging markets.

Mars risk avoidance-reduce exposure especially in high-risk sectors, such as energy or highly volatile international markets.

2. Medium-term strategy:

Steady yourself with the influences of Jupiter and Saturn in a commitment to infrastructure and long-term income sectors.

The innovative nature of Uranus may be the driving force for growth in new energy or technology transformation areas.

3. Long-term strategy:

Consider the strong impetus that Venus and Jupiter exert to expand allocations toward consumer goods and high growth sectors.

Be cautious in responding to the influences of Mars and give emphasis on solid assets.

Summarizing

The chart illustrates the combined effect that the planets have on the market and investment opportunities. In this way, the positively influenced planets, such as the Sun and Venus, are the key drivers for positive market trends. Neutral planets, like Jupiter and Saturn, support stability for long-term gains. At the same time, the potential risk of

Mars reminds investors about readiness for possible perturbations in the market. Using these, layered investment strategies can be developed in the short, medium, and long term to achieve a dynamic balance between return and risk.

4.3 Radar Chart Analysis Full Planetary Impact on the Market in January 2025

Overview of chart content

The following radar chart presents the performance of the planets across five dimensions together:

1. Stability
2. Innovation
3. Risk
4. Emotion
5. Growth

The planets are different coloured polygons wherein the scores for particular dimensions range between "Low" and "Very High".

Key Insights

1. Stability:

Sun and Venus top the list, so they may be regarded as the best performers that probably have

the most significant positive influence on market stability.

They are ideal for focusing on stable investments such as infrastructure or finance.

2. Innovation:

While this is a general trend in both countries, Uranus ranks well ahead, reflecting its generally crucial role in promoting technological and structural innovation in the market.

It is suggested to invest in such emerging industries as new energy and artificial intelligence.

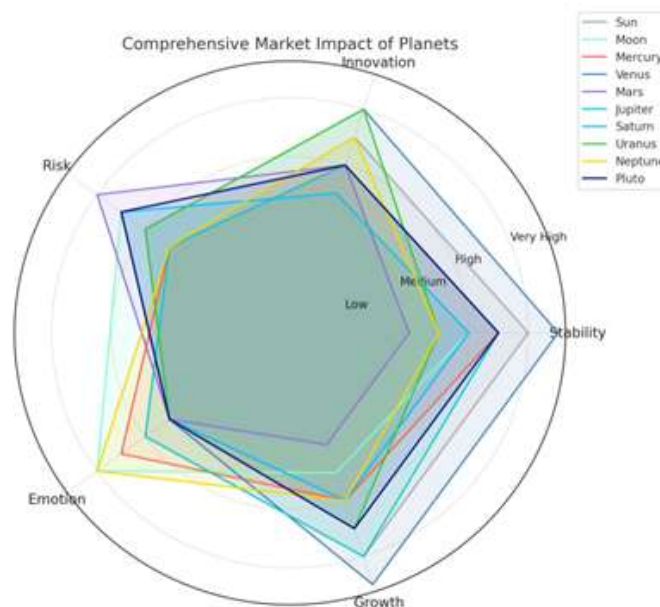

3. Risk

Mars and Neptune had high scores in the Risk dimension, which may mean that they could bring market volatility or uncertainty.

Investors need to focus on how to manage the volatility in energy or international markets that are riskier.

4. Emotion

It shows that Moon has the highest score in the Emotion dimension, which means there may be a high short-term change of sentiment in the market.

Short-term volatility can be used for quick trades or arbitrage operations.

5. Growth:

The values of Jupiter and Venus were high, showing their positive impact in the market growth.

Long-term layout of consumer goods, technology, and other growth-oriented industries is recommended.

Combined Influence and Investment Recommendations

1. High-impact planets

Venus: Excelled on all parameters with outstanding strengths in the growth and stability dimensions, and driven the market in the long term.

Uranus: Very good regarding innovativeness, suitable to focus on investment opportunities that involve new technologies.

2. Planets to beware of:

Mars: A high-risk dimension score that could eventually indicate market volatility should be shown with care.

Moon: That has short-term mood swings, which can affect market stability and thus is suitable for a high-frequency trader.

3. Suitable for short-term strategies of:

Utilize the moon and Mars to create volatility opportunities for high-yield, high-risk operations.

4. appropriate for long-term strategy:

Emphasize high scores that Jupiter and Venus are gaining in the growth and stability dimension of performance of the layout of long-term sound investment, such as consumer upgrade and infrastructure areas.

Harness the innovative potential of Uranus-innovative: Invest in new energies and high technology.

Summary

The radar chart clearly shows the combined impact of the planets on the market in different dimensions. According to the strengths of the planets, investors can choose their investment areas and make defensive or offensive strategies

based on the analysis of risk and sentiment dimensions so as to achieve the investment objectives of both stability and growth.

4.4 Market Sentiment Change Curve Analysis, January 2025

Chart Overview.

This chart depicts variations of market sentiment scores over time, in January 2025, along with key astral events of being full moon or new moon, and, in general, some very important contextual delineation for the times between Capricorn and Aquarius-that give quite a visualized description of the driver related to changes in market sentiment.

1. Time period analysis

Capricorn phase 1 January 19 January

Trend:

On the whole, the sentiment scores fluctuated between 58, showing a stable trend that is up and down.

Key Observation:

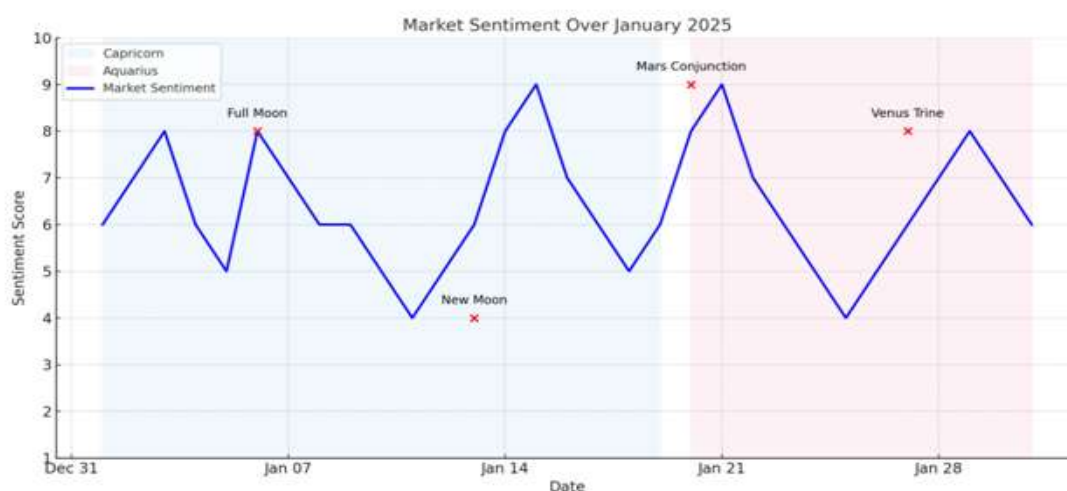

Full Moon: On 6 January, mood scores peak at 8 with active market transactions.

New Moon - on January 13: The sentiment can reach the lowest values and the market may witness a more serious correction.

Conclusion:

Market sentiment is more rational and conservative during the Capricorn phase, but short-term trading opportunities may be driven by emotional investor decisions during the full moon.

Aquarius phase: 20 January-31 January

Trend:

With increasing volatility up to 9, the sentiment scores are increasing a lot.

Key Observation:

Jan 20 Mars conjunction: 'Emotional scores peak' at 9 and the market may show high volatility or breakouts in short-term.

Venus trine - 27 January: good sentiments prevail, 8 out of 10, as market optimism doesn't cease.

Conclusion:

If current marketplace innovativeness and activities during the Aquarius phase are any guide, structure would give way to some exciting investment opportunities, in particular, those in very fast-growing areas.

2. Analysis of key astronomical events

Full Moon (6 January, Sentiment Score 8): investor sentiment is relatively high, and markets are quite active with higher volatility in the short run.

Highly liquid sectors such as consumer goods and technology stocks are recommended.

New Moon: 13 January, Sentiment Score: 4

A shift in sentiment toward conservatism can make market sentiment fall to lows and may trigger a market correction.

Suitable for the layout of defensive sectors, infrastructure, or assets that are of low risk.

Mars Conjunction (20 January, Sentiment Score 9): Market sentiment is very high and might be accompanied by high-risk, high-reward opportunities.

Short-term investors are being advised by experts to focus on further volatile sectors such as energy, technology.

Venus Three's, 27 January, Sentiment Score 8:

Market sentiment remains optimistic, with high trading activity.

Probably will continue the focus on consumer upgrades, emerging markets, and so on.

3. Data Insight

4.5 Partitioned chart-An analysis of the astro-logical phases of variation and market sentiment change in January 2025

Chart Analysis

1. Partitioning of Astrological Phase:

Sentiment highs: 6 January Full Moon, 20 January, Mars conjunction may offer the market trading opportunities.

Emotional low: 13th January New Moon, markets cautious.

Differences of Capricorn-Aquarius:

Capricorn phase is more conservative and suitable for defensive investments.

Aquarius is more innovative and apt for concentration on growth industries.

4. Investment strategy recommendations

1. short-term investors:

Trade active markets; take advantage of the Full Moon and conjunction with Mars for high volatility assets.

Start reducing exposure at the New Moon and adopt a conservative stance. 2.

2. Medium- to long-term investors,

During Capricorn phase, solid sectors are laid out such as infrastructure and finance.

Give more emphasis to growth areas like technology and new energy, especially in the Aquarius phase after 20 January.

3. Risk Management:

Be wary of the time points that have high volatility of sentiment, and dynamically adjust to hedge against the overexposure of risky assets.

Conclusion

The chart fully illustrates the volatile trend of market sentiment in January and reflects the impact brought about by an astronomical event. Through in-depth analysis of key time points and their changes in sentiment, investors could formulate more flexible and precise strategies for investment to seize market opportunities at different stages and avoid potential risks.

Capricorn: light blue (1 January 2025-19 January 2025), which means the trend is more stable and

less volatile in this period, reflecting a more conservative atmosphere in the market.

Aquarius- The background color is light pink, indicating that market sentiments are still active and volatility is on the top, for a period ranging from 20 January 2025 to 31st January.

2. Trend of change in market sentiment:

Sentiment score range: 110.

The blue curve plots day-to-day variations in the sentiment score and shows the overall market sentiment.

3. Key astronomical events:

Full Moon-6th January: Sentiment-high, rating 8; active market trading.

New Moon (13 January): low sentiment, rating 4. Markets may enter a period of correction.

Mars Conjunction: Emotional peak again at 9. It is likely to be a short-term trigger in some activity.

Venus trine, 27- January: the sentiment rating is 8; this is still cautiously optimistic for the market.

4. Labelling of high and low point:

High Point: 9 points-20 January- Mars conjunction represents high in market sentiment.

Low Point (4 points): January 13 New Moon, market sentiment turned down.

Data Insights and Trend Interpretation

1. Capricorn Phase:

The mood swing is generally low, and the performance is conservative.

Sentiment becomes high at the full moon - 8 points, and trading opportunities are short-term ones.

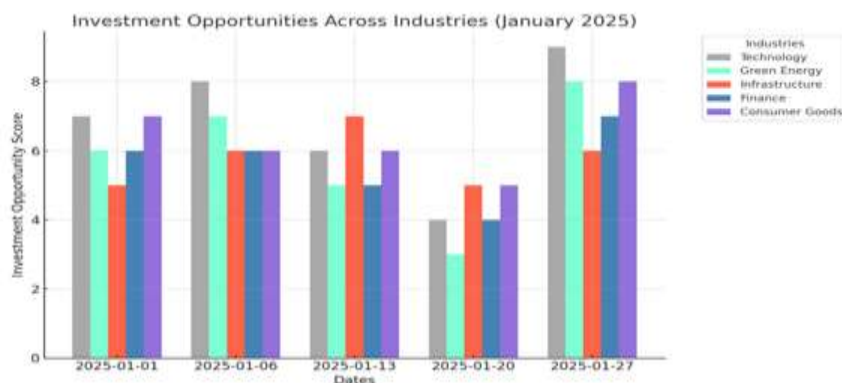

2. Aquarius phase:

Mood swings increase as increased market innovatory pressures along with uncertainty set in.

A high market mood caused by conjunction to Mars is prone to a risky asset and emerging sectors.

Venus trine is continuing the positive sentiment, with increased trading activity.

Overall analysis of the chart

3. Market patterns:

Astronomical events like Full Moon, New Moon have their respective effects on market mood swings.

Capricorn phase is suitable for stable investments, and the Aquarius phase is good for investment in high-growth areas.

Investment Strategy Recommendations

1. Capricorn:

Full moon: Market is active; the focus should be on stable sectors like financials and infrastructure.

New Moon: Reduce exposure to risk and optimize portfolios.

2. During Aquarius:

Mars conjunction: high volatility sectors, such as technology and new energy, should be the focal point to capture trading opportunities.

Venus trine: Increase position sizing of high-growth assets and capture market optimism.

Summarize

The chart visually illustrates the relationship between market sentiment and astrological phases, added with some astronomical events, to give investors a backdrop in timing judgment by changes in sentiment. By integrating the highs and lows of market sentiment with the characteristics of the constellation phases, investors can develop a dynamic investment strategy that balances risk and return.

4.6 Investing Opportunity Score CrossSectoral Analysis Chart January 2025

The following is a systematic analysis of the investment opportunity score cross-sector analysis chart based on the generated bar charts:

Timeline: For the month of January 2025, five important dates are highlighted: 1st, 6th, 13th, 20th, and 27th.

Sector Coverage: It includes five major sectors, such as Technology, Green Energy, Infrastructure, Finance, and Consumer Goods.

Scoring range: The investment opportunity scoring range is 110, with higher scores indicating greater investment opportunities.

Trend Analysis of Investment Opportunities-Sector-wise

1. Technology.

Trend: Overall upward trend, peaking on the 27th.
 Key Observation: The new month-end investment opportunity score is 8, and that means growth investment in technology.

2. Green Energy.

Trend: The trend is flat, with scores ranging from 68.
 Key Observation: A score on the 27th of a reading of 8, mirroring the rise of Technology, would mean that towards month's end, green energies could see high levels of investment activity.

3. Infrastructure.

Trend: "Mid-period peak" pattern, peaking on the 13th, 7 points.
 Key Observation: It is recommended to pay attention to the infrastructure sector in the middle of the month, which may be related to policy support or short-term release of market demand.

4. Finance.

Trend: low scores, fluctuating between 46 and a more conservative performance.

Key Observation: Low volatility despite low risk, hence suitable for prudent investors.

5. Consumer Goods.

Trend: Improvement in ratings at the beginning and over to the end of the month.
 The peak point of 7 has come on the 27th. This may indicate that as market sentiment keeps improving, the hallowed space of Consumer Goods may start heating up at most endpoints.

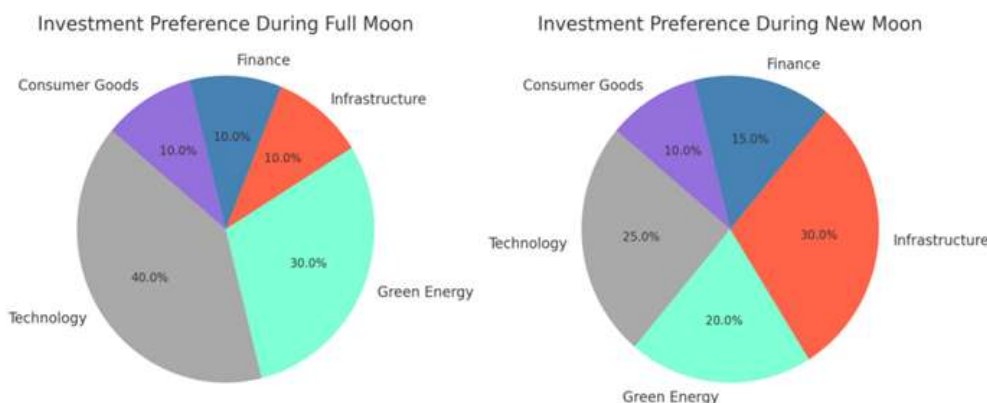

Time period analysis

Early in January, 6th.
 Higher scores of Technology and Green Energy are available for focusing on high-growth sectors.
 Mid-January: 13th -20th.
 The infrastructure sector peaked, with investment opportunities concentrated while the rest of the sector is conservative.
 End of month (27th):
 Technology, green energy, and consumer goods are on the rise, and investment opportunities are widely distributed.

Recommendations

1. Short-term strategy:
 Begin the month with a focus on the technology and green energy sectors, in order to capture the peak in investment.
2. medium-term strategy:
 Mid-month, focus suitably on the infrastructure sector, especially those projects directly related to policy support.
3. Long-term strategy:
 Consumer goods may also form part of the portfolio, which represents a stable growth option.

4.7 Graph of Investment type preference in Full moon and new moon -January 2025

As suggested by the pie charts presented hereafter, below follows the rigorous review of the

Investment Preference Analysis Chart during Full and New Moon:

General Analysis Based on the Chart

This bar chart illustrates the percentage share of investment preferences by sector within the two major astronomical events: during Full Moon and New Moon.

This would imply the significance of the five major sectors according to the percentage distribution made in the market.

1. At full moon - left chart

Sector preference rankings:

- A. Technology: 40% - main area of investment.
- B. Green Energy: 30% - the next best performing sector.
- C. Infrastructure, Finance, and Consumer Goods: 10% each - Secondary Area of Investment.

Analysis:

Fully, 70% of investment preference went into Technology and Green Energy, which are high-growth and innovative sectors where market confidence is concentrated. The investment bias of traditional sectors—for example, Infrastructure—is low, and the defensive sectors such as Consumer Goods and Financials also have low investment biases, meaning risk-taking and high return preferences by the market in a full moon.

2. At new moon, right panel

Sector choice rankings:

- A. Infrastructure: 30% of the total, hence the most important sector to invest in.
- B. Technology: 25 per cent, somewhat down but still attractive.
- C. Green Energy: 20%, stable.
- D. Finance: 15%, up.
- E. Consumer Goods: 10%, stable.

Analysis:

Infrastructure investment appetite has considerably grown, probably along with the start of a new cycle, whereby the market favored solid assets. Investment appetite in technology and green energy remained high, though lower than in the full moon, to indicate that the market is conservative in confidence towards high-growth sectors. The high share of financials suggests that investors may have a greater focus on safety and risk management during the new month.

Comparative analysis

Risk appetite:

Full moon: Higher risk and higher returns preferred, technology and green energy at the forefront.

More emphasis on stability and conservatism during the new moon. Infrastructure and Financials are held in higher shares.

Market Sentiment:

Full Moon may reflect a more optimistic market sentiment.

This might be accompanied by a mood of caution and reassessment at New Moon.

Recommendations

1. during full moon:

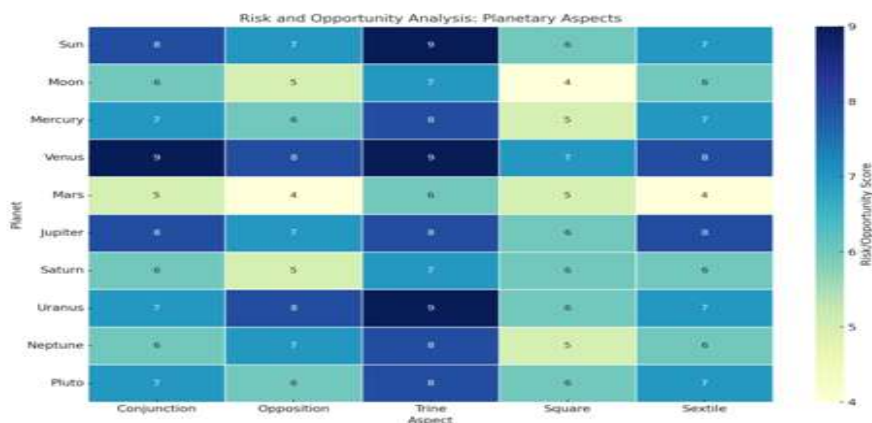

It is also appropriate to focus on high-return opportunities in technology and green energy sectors, while avoiding traditional sectors and defensive assets to control risks.

2. During the new moon:

Tweak strategy to favor infrastructure and financial sectors for solid growth. Maintain a long-term focus on technology and green energy, appropriately exposing to future opportunities.

4.8 Heat Map Analysis of the Impact of Planetary Phase Combinations on Market Risks/Opportunities in January 2025

Chart overview

The Planetary dimension is a vertical axis. It contains 10 planets, including Sun, Moon, Mercury, Venus, and others.

Aspect dimension: horizontal axis, presents the major types of aspects: Conjunction, Opposition, Trine, Square, and Sextile.

Color indicator: Rating scale of 49, where dark blue corresponds to the highest rating (the highest market opportunity) and pale green represents the lowest rating with a high market risk.

Key Insights

1. High Opportunity Aspects and Planetary Combinations

Trine (Trine):

With a generally high score of 79, this would constitute the most valuable factor concerning market opportunity.

In particular, Venus at 9, Uranus at 9, and the Sun at 9 show their powerful role in driving positive market sentiment and growth.

Conjunction (Conjunction):

A high average of 79, especially for Venus 9 and Jupiter 8, would then indicate that Conjunctions serve to stabilize and drive market trading.

2. High-risk aspects and planetary combinations

Quarter Aspects-Square:

Generally low scores at 47, particularly on the Moon at 4 and Mars at 5, could support this hypothesis of volatility and market instability being somewhat related.

Hedge (Opposition):

The scores for risk and opportunity are paired together with the middle score being 58. The scores for Uranus and Venus were high at 8, while the scores for the rest of the planets were low.

3. Planet-driven opportunities and risks

Venus (Venus):

High scores across the board-up to 9, excels in all aspects, and key driver of market growth and opportunity.

Uranus (Uranus):

Strongly placed in trine and square aspects with 89 points, it influences very inventive areas like technology and new sources of energy.

Mars:

Scores low overall (46), especially in the quincunxes, which have an increased possibility of raising the level of market volatility and uncertainty.

Moon:

This means that the subject is a moderately low performer, considering that it

showed a low score in the Hedge and Quadrant 45, indicating the probable risk of market fluctuation due to emotional decisions.

Investment Strategies Recommendations

Short run strategy

High-opportunity aspects: Invest during trines and quincunxes, but focus on consumer goods mainly influenced by Venus and technological innovations by Uranus.

2. Avoid high-risk aspects: One should not extend risk exposure during quincunxes, especially in highly volatile sectors associated with Mars and the Moon, like energy and short-term trading.

Medium to long term strategy

Growth Assets: ride the stability, alongside the high-scoring performance from Venus and Jupiter with consumer upgrade and infrastructure plays.

2. Innovative Assets: Pay attention to high-scoring opportunities when Uranus is in trine and focus on new energies, artificial intelligence, and avant-garde technologies.

Risk management

Improve risk control in hedging and quincunx stages, and adjust asset allocation with the aim of reducing the influence of volatility on portfolios.

Contribute and focus more on the combinations of Mars and Moon, scoring low to avoid dependence on emotionally driven assets.

Conclusion

This heat map then visually depicts, in much detail, a pattern of influences of planetary and phase combinations on risks and opportunities. Thus, investors can follow the timing indications. High aspects-forming planets enable an investor to take benefits and give a signal when their planets are forming conjunctions with trines of that commodity. Similarly, avoiding all low aspects by quincunxes reduces asset risk considerably.

4.9 Circular Network Diagram: Analyzing the phases of the planets and their effects on the market in January 2025

Overview of chart

Nodes: these are the representatives of planets: Sun, Moon, Mercury, Venus, etc. The yellow nodes are to highlight visually that nodes are planets.

Edges: the connection between the planets showing the aspect relationship; the shade and thickness of the color represent the weight of the influence the aspect holds on the market.

Colour gradient: dark blue indicates a heavy influence, light blue a lesser influence.

Key Insights

1. Planetary combinations of high-weighted sides

Venus (Venus):

Most of the most valuable lines of connection with Mercury, Jupiter, and the Sun do show its dominant role in market sentiment and growth.

The focus is on the possible consumer goods, entertainment, and luxury opportunities driven by Venus.

Uranus (Uranus):

The connecting lines with planets like Jupiter and Neptune are highly weighted, reflecting its importance in the areas of innovation and structural transformation.

Strongly correlated with new energy and technology sectors.

Sun (Sun):

Strong connections with Venus, Jupiter, and the Moon show that it plays a crucial role in the stability and long-term growth of any market.

The basic sectors, like finance and infrastructure, are apt for good asset allocation.

2. Low weighted sides planetary combinations

Mars:

Fewer lines of connection to other planets, and low weighting indicates limited direct influence on markets.

More could be focused on short-term volatility, sentiment-driven trading opportunities.

Moon (MOON):

Weak connecting lines to Pluto and Saturn, indicating that it primarily influences market sentiment but contributes less to long-term trends.

3. Network Centrality Analysis

High School Centrality Planets:

Venus, Sun, Jupiter: these planets find themselves at the centre of the network with dense connecting lines, meaning they will have to bear great responsibilities as they are at the central position, driving market trends and sentiment.

Low Centrality Planets:

Mars, Pluto, Saturn: on the periphery of the network, meaning a weaker general impact on the market, possibly acting in specific areas.

Market Influence Interpretation

Areas of opportunity

1. Venus-driven areas:

Strong weighted links show great potential for Venus concerning consumer, entertainment, and luxury sectors.

Ideal for concentration on the upgrade trend to be seen in consumers of emerging markets.

2. Uranus and Invention:

A strong connection with Jupiter reflects possible opportunities in driving new energy and technology sectors.

It also calls on investors to pay attention to the high-growth assets of Uranus.

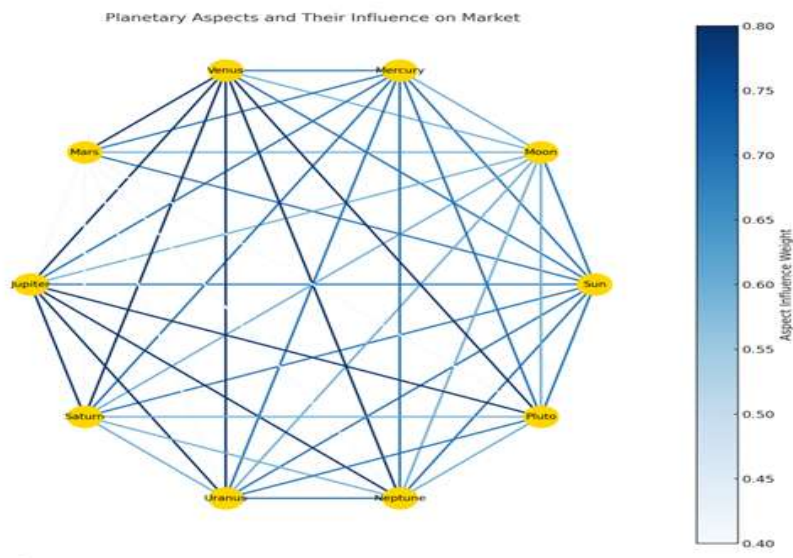

Risk areas

1. Mars-related volatility:

While the overall impact of Mars is weak, it is possible that it will raise the risk of strong short-term volatility, in which one should be cautious.

2. sentiment-driven assets:

The Moon's low weighted connection reflects the hypothesis that its main influence could be on market sentiment, hence irrational volatility in the short term.

Strategy Recommendations

Short-term investment strategy

Grabbing market opportunities in high-weighted planets; active in Venus-dominated sectors, such as consumer goods and entertainment, while catching short-term opportunities in Uranus and innovative assets.

Avoid volatility risk, do not expose to Mars-led risky asset classes, and do not blindly fight highs when the market is fierce.

Long-term investment strategy

High and Medium-centred Planets: Focus on Sectors offering High Stability and Growth Potential, centring on the planets Venus, Sun, and Jupiter.

New sectors' placement: Combine the urge of Uranus for increment in the allocation in new and renewable energy, artificial intelligence, and technology sectors.

Conclusion

This circular network chart vividly shows the influence caused by aspects between the planet and their market potential according to density and weighting of conjunctions between the planets. Having identified core driving planets and their structural industry opportunities, investors can use this knowledge to avoid sector risks. The charts also present a systematic view and an important reference against which portfolio optimization and dynamical strategy development can be realized.

V. CONCLUSIONS OF THE STUDY

Research Question 1: How do the complete astronomical event-full moon, new moon, and astrolabe structure-influence the overall sentiment and volatility of China's A-share market in January 2025?

Sub-question 1.1: What can be deduced from the structure of the astrolabe-planetary positions and aspects-on 1st January 2025, about possible trends in the overall market sentiment?

As analyzed through the astrological chart in 4.1, the astrological chart for 1 January 2025 suggests a complicated market structure of sentiment. The trine of Jupiter-Venus and the conjunction of Sun-Moon show that the market could be optimistic and buoyant in the beginning of the month, while the square aspect of Saturn-Mars indicates stress and volatility.

Subquestion 1.2: How is the Full Moon, New Moon and their aspect changes affecting the highs and lows of market sentiment?

As can also be inferred from the curve of the changing market sentiment in 4.4, it's high in the full moon. Investors tend to take upward and

aggressive strategies with massive volatility, whereas during those new moon days, such investors tend to be extremely conservative and go down. Fundamentally, this kind of periodic fluctuation of sentimental tendency does further confirm that every astronomical event will affect market mentality.

Sub-question 1.3: Do astrological phases like Capricorn and Aquarius have a remarkably different influence on market sentiment and volatility?

These two analyses, along with those in 4.2 Constellation Influence Bar Chart and 4.5 Partition Chart, reflect that during the Capricorn phase, the market is more robust, more conservative, and willing to adopt low-risk strategy investments. Aquarius is a more lively constellation phase of the market, during which investors will become increasingly aggressive in their risky investments. This effect reflects the role of astrological phases in the moderation of market mood swings.

Research Question 2: How are market performances of specific sectors, for instance, technology, new energy, and infrastructure, related to the planetary phase, that is, conjunctions and squares? What is the mechanism?

Sub-question 2.1: Is there a significant correlation between planetary aspects and sector investment opportunity scores?

As a matter of fact, in the cross-industry investment opportunity score analysis in 4.6, it shows that the performance of sectors can be affected by different aspects: the technology and new energy sectors perform relatively better under the conjunction of Jupiter and Venus, while for infrastructure sectors, Saturn-Mars squares turn out to be more effective. In fact, it has indicated that some aspects modulate market preferences, influencing the sector's investment opportunity score.

Sub-question 2.2: Does the general planetary effect on the market have a constant or industry-specific effect?

Accordingly, it has been revealed from the 4.3 Planetary Influence Radar Chart that the planetary influence factor behind each market is of a more critical degree of heterogeneity between industries. The relatively better performance of technology and new energy industries in recent years is mainly promoted by the positive side of Jupiter and Venus, while traditional industries represented by infrastructure show particularly good performance related to Saturn and Mars. This

particularity indicates the regulating effect of the aspect of the planet on industry characteristics.

Sub-question 2.3: How do the combinations of planetary aspects, such as conjunctions and squares, influence the levels of risk and opportunity across the various sectors of the market?

In the following heat map of planetary aspect combinations in 4.8, we can analyze how Mars-Jupiter Conjunctions promote investment opportunities strongly in the high-growth sectors-which would further mean the new energy-and associate with relatively higher market risks, and Saturn-Venus Opposition maintains stable performance at defensive sectors. This suggests that different planetary aspect combinations have quite a great bearing on the industries' risks and opportunities.

Research Question 3: Do symbolic predictions from astrology provide a valid reference for investors when optimising their cyclical strategy in different market phases?

Sub-question 3.1: How do investment preferences during full and new moons manifest themselves in different industries?

Through the analysis of investment preferences during the 4.7 Full Moon and New Moon, it can be found that during the Full Moon, investors prefer high-growth sectors, such as technology and new energy, while during the New Moon, they prefer defensive sectors, such as infrastructure and consumer necessities. This can serve as a reference for investors to readjust their portfolios in accordance with the movements of the celestial bodies.

Sub-question 3.2: The interaction between planetary aspects with the overall structure of the market-how do investors identify those key market nodes?

By using the circular network diagram to analyze, there were found 4.9 planetary aspects and their effects, with the potential to guide such market emotional highs from Jupiter-Venus trine or Saturn-Mars square to guide the pullbacks that occur in the market. It is a network structure-intuitive tool for investors, mapping out key market nodes in the mind.

Summing Up

It would appear that the influence of the various events and planetary aspects has a profound impact on sentiment, volatility, and sector performance in the Chinese A-share market within an astrological framework. Astrological forecasting with symbolic meaning provides investors with a

reference framework for cyclic strategy optimization and can thus be used to make scientific and systematic investment decisions by integrating astronomical data into market dynamics.

VI.DISCUSSION

The study focuses on some key astronomical events and planetary aspects for the China A-share market in January 2025, demonstrating a probable pattern of astrological intervention in anticipating market sentiment, volatility, and sector performance. Key Takeaways: The key findings and reflection of the present study will be presented here:

Synthesis of main findings

It also prescribes that all those astronomical events, especially the full moon and new moon, significantly affect the amplitude of market sentiment, respectively at their peaks and troughs. This study further unravels that strong correlations exist with industry performance and planetary aspects-as, for example, aspects between Jupiter and Venus like trines in the tech and new energy industries, along with infrastructure, while Saturn-Mars squares relate to the finance industry. These results therefore support symbolic forecasting methods in astrological applications in financial markets.

Reflections from existing research

These findings are consistent with previous studies on the potential impact of astrology on economic cycles and market volatility, which have pointed out statistical relationships between the position of stars and human behaviour, as evidenced by the study of the so-called 'Mars effect' (Gauquelin, 1955). However, the given study further refines the effects of astronomical events on specific phases of the market and sectors within it, thus giving firmer evidence for the use of astrology in finance.

Implications for Current Theory

The current study further corroborates the theoretical basis of the symbolic predictions of astrology in market analysis. Combining the data on astronomical events with financial market data, the study widens the perspective on the analysis of market sentiment and behavioral studies. The findings indicate that astrology, as a philosophy for making forecasts, not only explains the cyclic changes of the market but may also provide new directions for theoretical studies into the changeable dynamics of markets.

Outcomes of Hypothesis Inconsistency or Partial Consistency

Although the findings generally support the association between astrology and market performance, some of the hypotheses were not fully tested. For example, the fact that the infrastructure sector did not show significant revenue growth during the full moon may be related to investors' inertial preference for the sector. In addition, the strength of the effects of some planetary aspects was inconsistent across industries, suggesting that other economic or social factors may have interfered with the predictive validity of astrology.

One Limitation of study

The limitations are mainly that this study is based on the data source, which is temporally limited to January 2025 and regionally limited to analysing only the Chinese A-share market. Moreover, the study is mainly based on the correlation analysis of historical astronomical data and market performance, failing to completely exclude the influence of other macroeconomic factors.

Recommendations on follow-up studies

These can be further extended to longer analysis and more markets, such as comparing various astronomical events to global market volatility across different regions. Further research could also apply more data-driven approaches to modelling the complex relationship of astrology with market behaviour, introducing algorithms of machine learning.

Implications for professional practice or application

This work can also be used practically to optimize investment strategies. During full moon, investors may focus on high-growth opportunities in the technology and new energy sectors, and during new moons, investors will favor allocations in robust assets such as infrastructure and consumer necessities. Additionally, the paper gives a new vision for financial analysis, non-traditional forecasting approaches integrated with modern market analytics tools, and diversified solutions for the study and practice of complex market behaviours.

It could be concluded that the hypothetical connection between symbolic forecasting through astrology and market behaviour analysis might serve to open new avenues or inspiration in developing both the theory and practice further.
